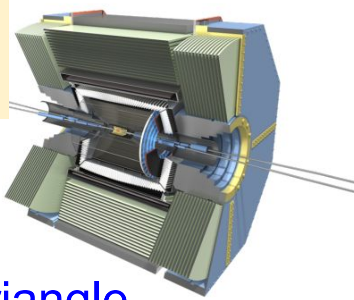
TDCPV and charmless B decays at Belle II

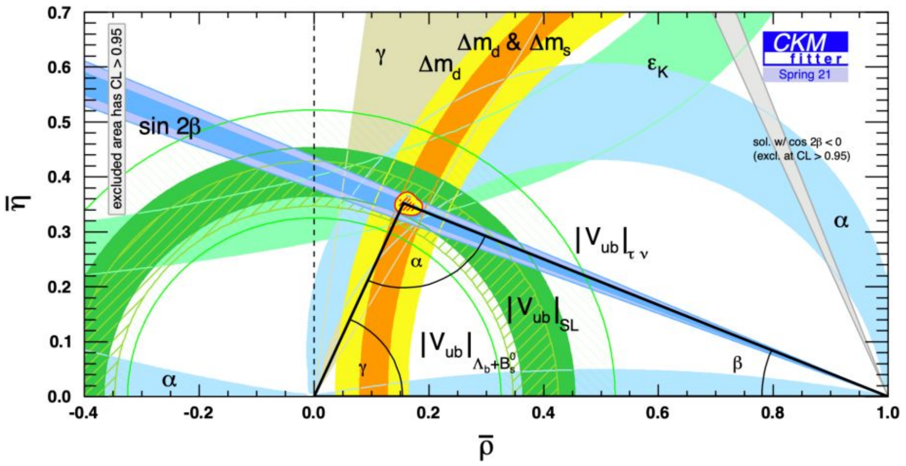
IPA2022, TU Wien, 06/09/2022

Stefano Lacaprara
for the Belle II collaboration
INFN Padova

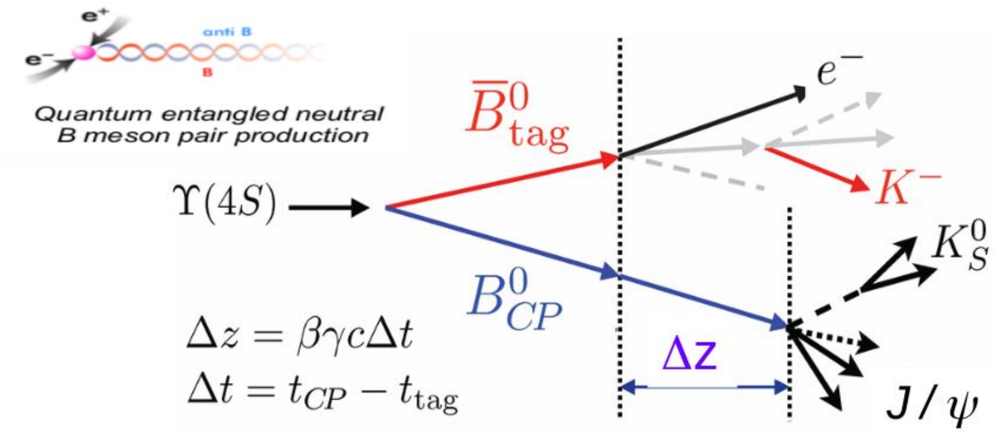
Motivation



- Belle II experiment at SuperKEKB
  - Collected so far **424/fb**: today will show results based on **~190/fb @Υ(4S)**
- Will improve existing precision measurements on CKM Unitarity Triangle over constraining it, as well search for new physics
- Can access many modes unique to B factories
  - In particular modes with neutrals, π^0, K_L, η(‘), …
  - Constrained kinematics and low background environment wrt LHC
- This talk:
  - Time dependent measurement
    - B^0 lifetime and mixing
    - **ϕ_1/β**
    - $B \rightarrow K_S K_S K_S$, $K_S \pi^0 \gamma$
  - Charmless B decay
    - $K\pi$ puzzle: $B \rightarrow K_S \pi^0 / K^+ \pi^0$
    - **ϕ_2/α**: $B \rightarrow \pi^0 \pi^0$, ρρ



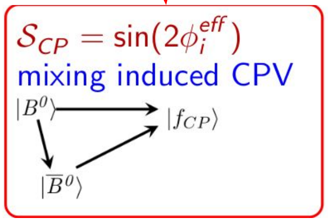
TDCPV analysis

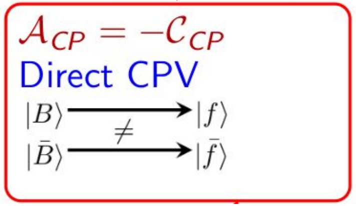


<Δz> ~ 130 μm at Belle II

Flagship measurement of the B Factories, still very important at Belle II;

$$\mathcal{A}_f(\Delta t) = \frac{\Gamma(\overline{B}^0(\Delta t) \to f) - \Gamma(B^0(\Delta t) \to f)}{\Gamma(\overline{B}^0(\Delta t) \to f) + \Gamma(B^0(\Delta t) \to f)} = S_f \sin(\Delta m_B \Delta t) + \mathcal{A}_f \cos(\Delta m_B \Delta t)$$





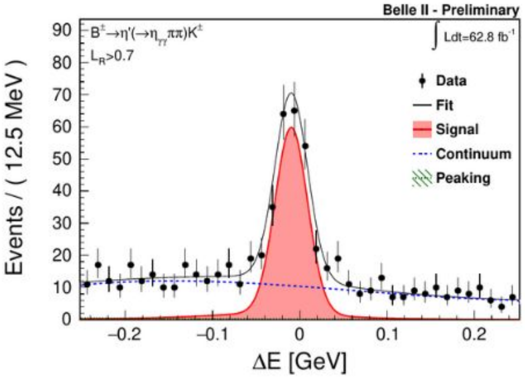
- **B_{CP}** fully reconstructed CP eigenstate
- **B_{tag}** vertex and flavour information
- Complex analysis, many key elements:
  - high signal efficiency
  - excellent vertex resolution σ_z~26/50μm (signal/tag side) [More on Tadeas' talk later today]
  - high flavour tagging efficiency $\varepsilon = 30\%$ [Eur. Phys. J 82, 283 (2022)]

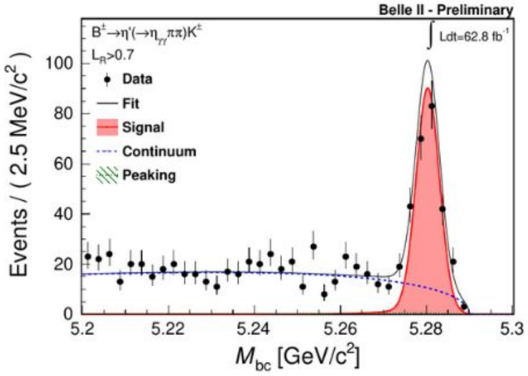
B-Factories variables

Two key variables discriminate against background for fully reconstructed (hadronic) final states:

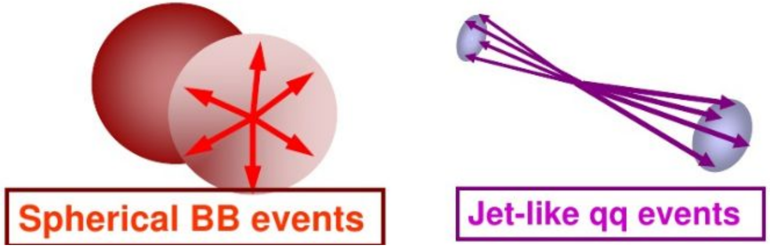
$$\Delta E = E_B^* - \frac{\sqrt{s}}{2}$$

$$M_{bc} = \sqrt{\frac{s}{4} - p_B^{*2}}$$





For many final states, the dominant source of background is the '$q\bar{q}$ continuum', which is suppressed based on the different topology with respect to $B\bar{B}$ events:



B^0 lifetime and mixing frequency

- Key step toward time dependent CPV analysis
  - Develop and validate Δt resolution function
- Signal side: $B^0 \to D^{(*)-}h^+$ ($h=\pi$,K)
- Tag side: assign flavour with Flavour Tagger

$$\mathcal{A}(\Delta t) = \frac{N_{B\bar{B}} - N_{BB,\bar{B}\bar{B}}}{N_{B\bar{B}} + N_{BB,\bar{B}\bar{B}}} = cos(\Delta m_d \Delta t)(1-2w) \otimes R(\Delta t)$$

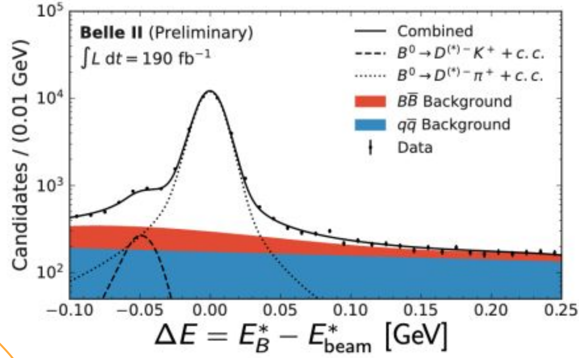
- Unbinned ML fit:
  - ΔE and continuum suppression BDT output
  - Use *sWeight* to get background subtracted Δt distribution
  - Fit τ_B and Δm_d

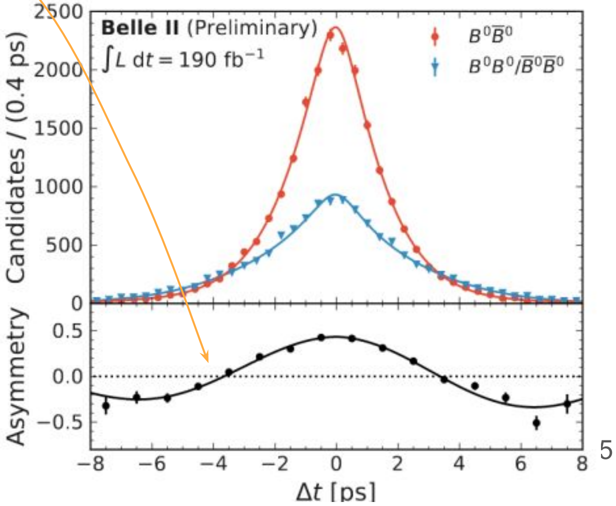
$$\tau_{B^0} = 1.499 \pm 0.013\,(\text{stat}) \pm 0.008\,(\text{syst})\ \text{ps},$$
$$\Delta m_d = 0.516 \pm 0.008\,(\text{stat}) \pm 0.005\,(\text{syst})\ \text{ps}^{-1}$$

- Better syst than Belle/BaBar
- Hard to compete with LHCb

Good agreement with WA

Signal yield: 33317 ± 203





$\sin(2\phi_1/\beta)$ from $B \to J/\psi K_S$

C. La Licata @ ICHEP 2022

- Golden channel, almost background free
  - Full TDCPV analysis
  - Using only K_s for the time being
    - K_L and other $c\bar{c}$ to be added
- Using resolution function developed for lifetime and mixing analysis
  - parameters from $B^0 \to D^{(*)-}h^+$ modes
  - Validation on $B^+ \to J/\psi K^+$
- $S_{CP} = 0.720 \pm 0.062(\text{stat}) \pm 0.016(\text{syst})$

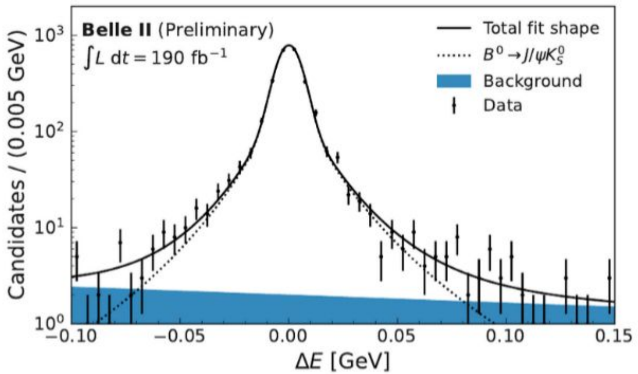
  $A_{CP} = 0.094 \pm 0.044(\text{stat})^{+0.042}_{-0.017}(\text{syst})$

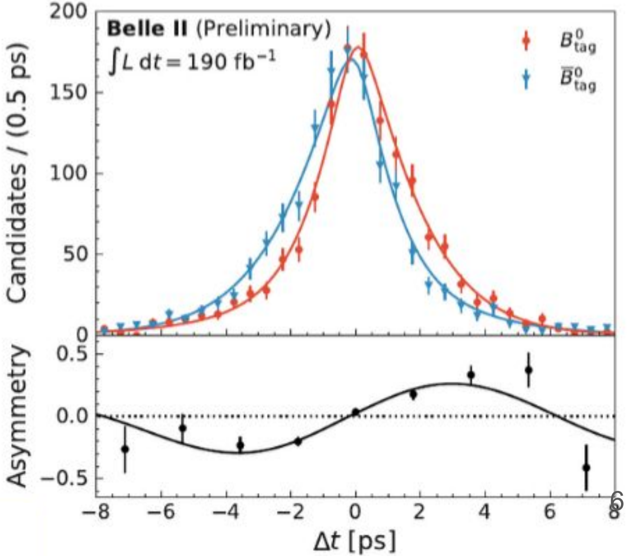
World average (K_S mode only):

$S_{CP} = 0.695 \pm 0.019$

$A_{CP} = 0.000 \pm 0.020$

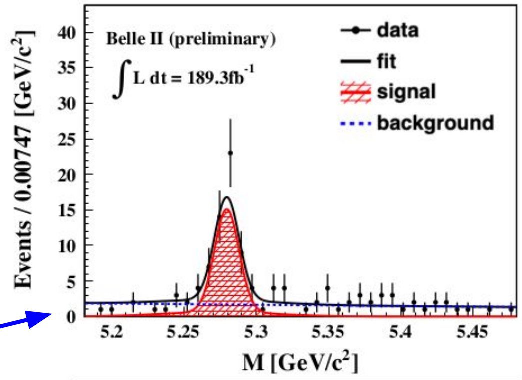
- Main syst:
  - for S_{CP} from size of control samples
  - for A_{CP} from tag-side interference and charge asym

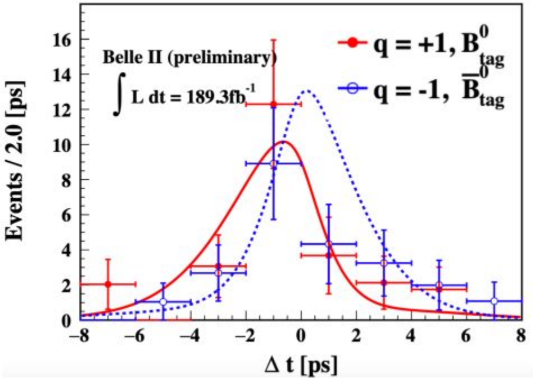




Time dependent B → $K_S K_S K_S$

- b→s decay mediated by penguin loop, potentially sensitive to new physics
  - Very reliable theoretically
- B vertex challenging: no *prompt* tracks from B, but only reconstructed $K_S \to \pi^+\pi^-$ extrapolated back;
  - For TD analysis (S_{CP}), using only candidates with enough hits on inner silicon vertex detector;
- Signal from 3-dimensional fit: M_{bc}, M_{KsKsKs}, $BDT_{Cont.Supp.}$
- Signal yield = 53 ± 8





$$\mathcal{S} = -1.86\ ^{+0.91}_{-0.46}\ (\text{stat}) \pm 0.09\ (\text{syst})$$
$$\mathcal{A} = -0.22\ ^{+0.30}_{-0.27}\ (\text{stat}) \pm 0.04\ (\text{syst})$$

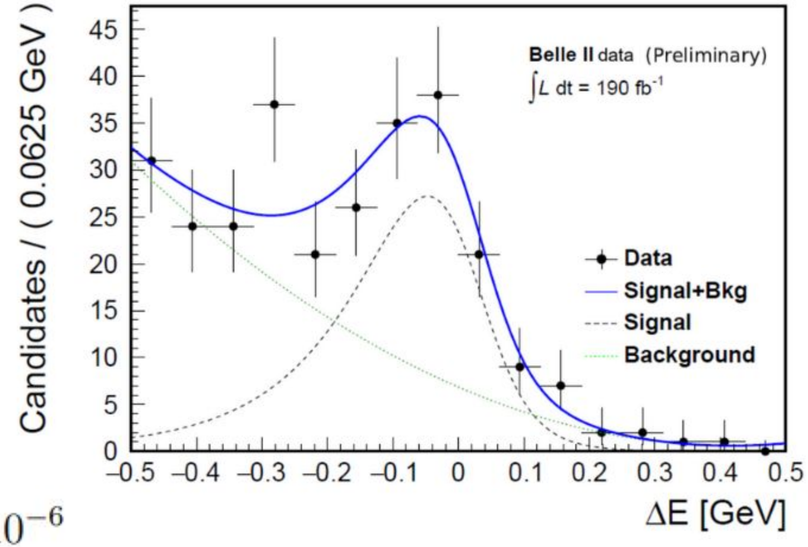
Conf regions in physical space

$B \to K_S \pi^0 \gamma$

arxiv:2206.08280

- $B^0 \to K_S \pi^0 \gamma$ is expected to have small/none mixing induced CPV in SM
  - $b \to s\gamma_R$ is helicity suppressed (m_s/m_b) wrt $b \to s\gamma_L$
  - $B^0 \to s\gamma_L$ vs $B^0 \to \bar{B}^0 \to s\gamma_R$
- First measurement of BR
- Signal selection:
  - $1.4 < E(\gamma) < 4.0$ GeV
  - $M(K_S\pi^0) < 1.1$ GeV/c^2
    - Dominated by $K^{0*}(892)$
- Fit ΔE to extract signal
- Results:
  - Yield: 121± 29 events



$$\mathcal{B}\left(B^0 \to K_S^0\pi^0\gamma\right) = \left(7.3 \pm 1.8\,(\text{stat}) \pm 1.0\,(\text{syst})\right) \times 10^{-6}$$

Full TDCPV analysis in progress

Time dependent $B \to K_S\pi^0$

arXiv:2206.07453

- Key ingredient of “$K\pi$” puzzle
  - Large unexpected isospin violation in $B \to K\pi$

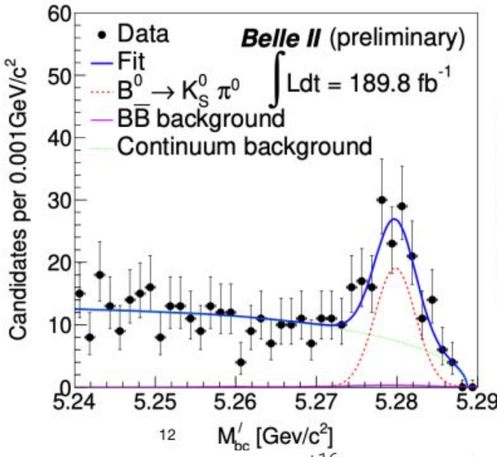
$$I_{K\pi} = \mathcal{A}^{CP}_{K^+\pi^-} + \mathcal{A}^{CP}_{K^0\pi^+}\frac{\mathcal{B}_{K^0\pi^+}}{\mathcal{B}_{K^+\pi^-}}\frac{\tau_{B^0}}{\tau_{B^+}} - 2\mathcal{A}^{CP}_{K^+\pi^0}\frac{\mathcal{B}_{K^+\pi^0}}{\mathcal{B}_{K^+\pi^-}}\frac{\tau_{B^0}}{\tau_{B^+}} - 2\mathcal{A}^{CP}_{K^0\pi^0}\frac{\mathcal{B}_{K^0\pi^0}}{\mathcal{B}_{K^+\pi^-}} \approx 0 \pm 0.01$$

  - Uncertainty (10x) dominated by $A_{CP}(K_S\pi^0)$: accessible only to Belle II
- Key challenge is signal decay vertex, from $K_S \to \pi^+\pi^-$ and IP constraint
  - Control channel $B \to J/\psi\, K_S$, with J/ψ excluded for vertexing
- 4D fit: M_{bc}, ΔE, Δt, $BDT_{Cont.Supp.}$

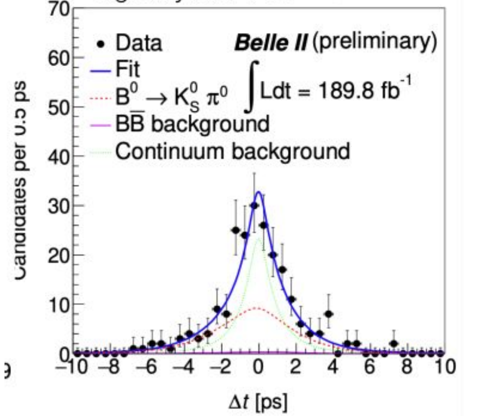
$A_{CP} = -0.41\,^{+0.30}_{-0.32}\,(\text{stat.}) \pm 0.09\,(\text{syst.})$

$\mathcal{B} = (11.0 \pm 1.2\,(\text{stat.}) \pm 1.0\,(\text{syst.})) \times 10^{-6}$

- $B^0 \to K^+\pi^-$, $B^+ \to K_S^0\pi^+$ arXiv:2106.03766 ; $B^+ \to K^+\pi^0$ (later)



Signal yield: $135\,^{+16}_{-15}$

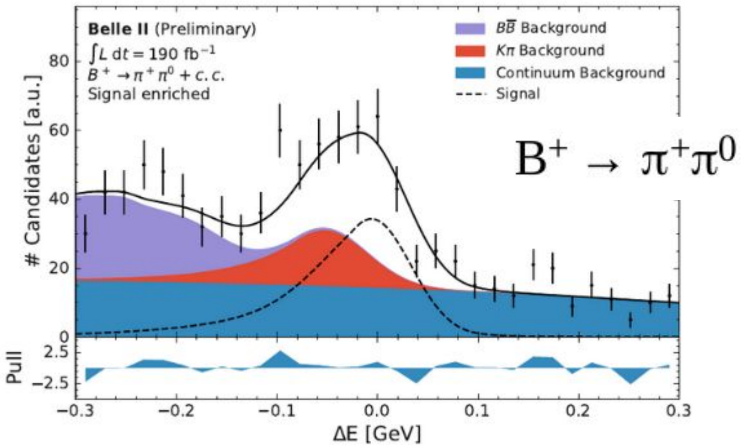


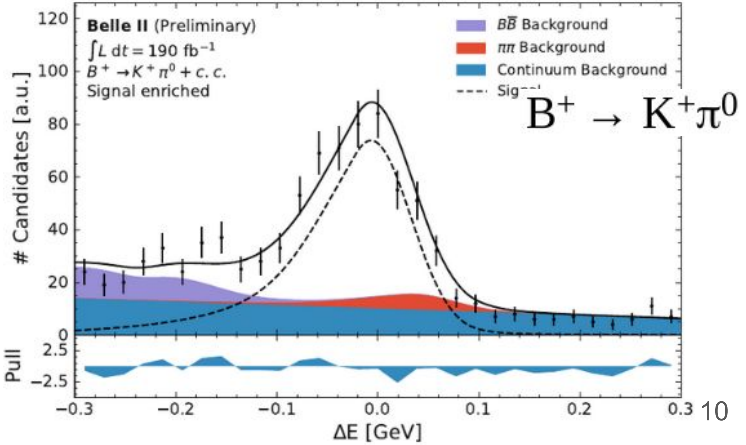
$B^+ \rightarrow K^+\pi^0 / \pi^+\pi^0$

- $B^+ \rightarrow K^+\pi^0$ enters in "Kπ" puzzle
- Using common selection for both channels
  - Enhance pion and kaon final state
  - Background from continuum $q\bar{q}$ reduced with MVA
- BR and A^{CP} from 3D fit on M_{bc}, ΔE, $BDT_{Cont.Supp}$
  - Simultaneous fit to both samples
  - $D^+ \rightarrow K_s\pi^+$ and $D^0 \rightarrow K^-\pi^+$ for detector asymmetries
- Results:

$$\mathcal{B}(\pi^+\pi^0) = (6.1 \pm 0.5 \pm 0.5) \times 10^{-6}$$
$$\mathcal{B}(K^+\pi^0) = (14.3 \pm 0.7 \pm 0.8) \times 10^{-6}$$
$$\mathcal{A}^{CP}(\pi^+\pi^0) = -0.09 \pm 0.09 \pm 0.02$$
$$\mathcal{A}^{CP}(K^+\pi^0) = 0.01 \pm 0.05 \pm 0.01$$

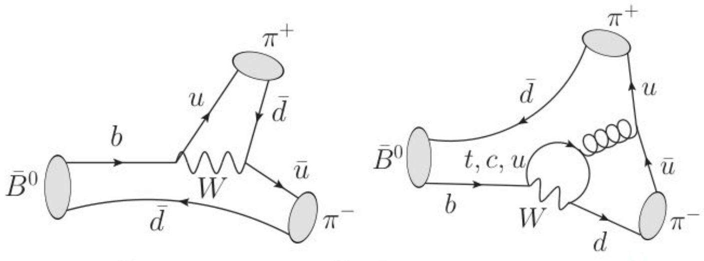
WA: $\mathcal{A}^{CP}_{K^+\pi^0} = 0.030 \pm 0.013$, $\mathcal{A}^{CP}_{\pi^+\pi^0} = 0.03 \pm 0.04$





Measurement of ϕ_2/α

Two amplitudes of comparable size with different weak phase:



Penguin in $B^0 \to \pi^+\pi^-, \pi^0\pi^0$, but not in $B^\pm \to \pi^\pm\pi^0$

$$\phi_2 = (\widehat{\bar{A}^{+0}, A^{+0}}),\ \phi_2^{eff} = (\widehat{\bar{A}^{+-}, A^{+-}})$$

Isospin analysis [Gronau-London PRL, 64 3381 (1990)]: constraints B^0 and $B^\pm$ amplitudes:

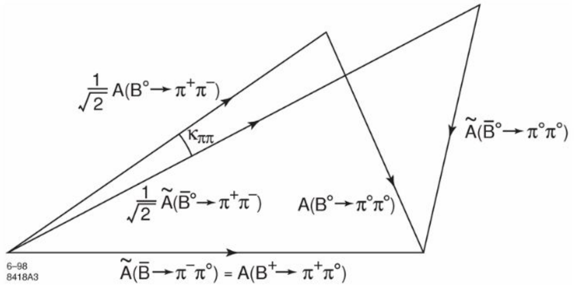
$$A^{+0} = A^{+-}/\sqrt{2} + A^{00}$$

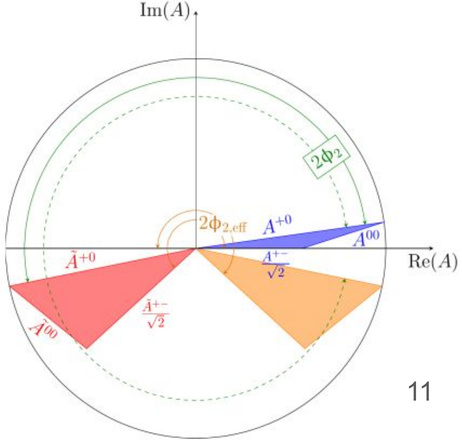
$$\bar{A}^{+0} = \bar{A}^{+-}/\sqrt{2} + \bar{A}^{00}$$

$$|A^{+0}| = |\bar{A}^{+0}|$$

Similar for $B \to \rho\rho$

- Need all branching fractions;
- Direct CP asymmetries: C^{+-}, C^{00};
- TD CP asymmetries: S^{+-}, S^{00};
  - S^{00} reduces folding ambiguities
- Belle II will be able to measure all these observables
  - Final sensitivity ~1°





$B^0 \to \pi^0\pi^0$

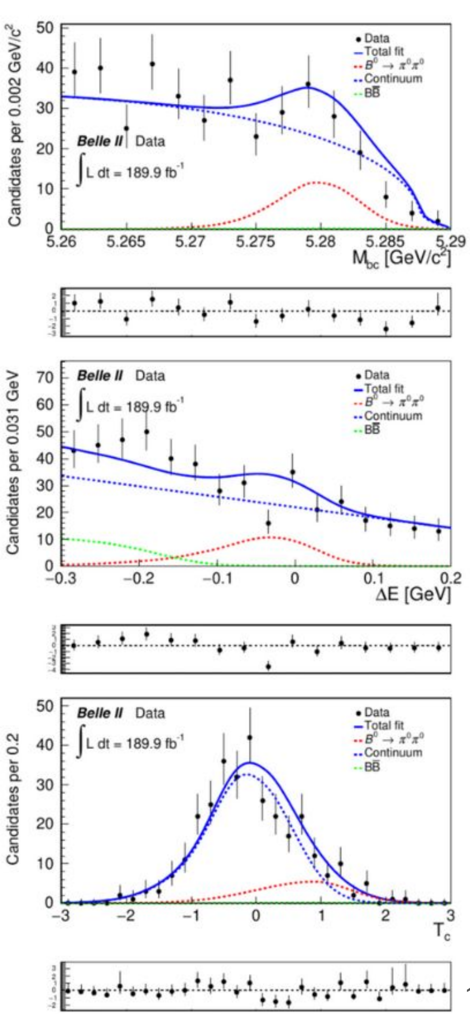
J. Skorupa @ ICHEP 2022

- Most challenging $\pi\pi$ mode, very hard for LHCb
- Fake photons background reduced with multivariate algorithm for $\pi^0 \to \gamma\gamma$ purity
- Control channel: $B^0 \to D^0(K^+\pi^-\pi^0)\,\pi^0$
- Using Flavour Tagger to get direct CP asymmetry
- Results:
  - N Yield: 93 ± 18

$$\mathcal{A}^{CP} = 0.14 \pm 0.46\ (\text{stat}) \pm 0.07\ (\text{syst})$$
$$\mathcal{B} = (1.27 \pm 0.25\ (\text{stat}) \pm 0.17\ (\text{syst})) \cdot 10^{-6}$$

WA: $\mathcal{A}^{CP} = 0.33 \pm 0.22$, $\mathcal{B} = (1.59 \pm 0.26) \cdot 10^{-6}$

- Competitive with Belle with ⅓ of dataset



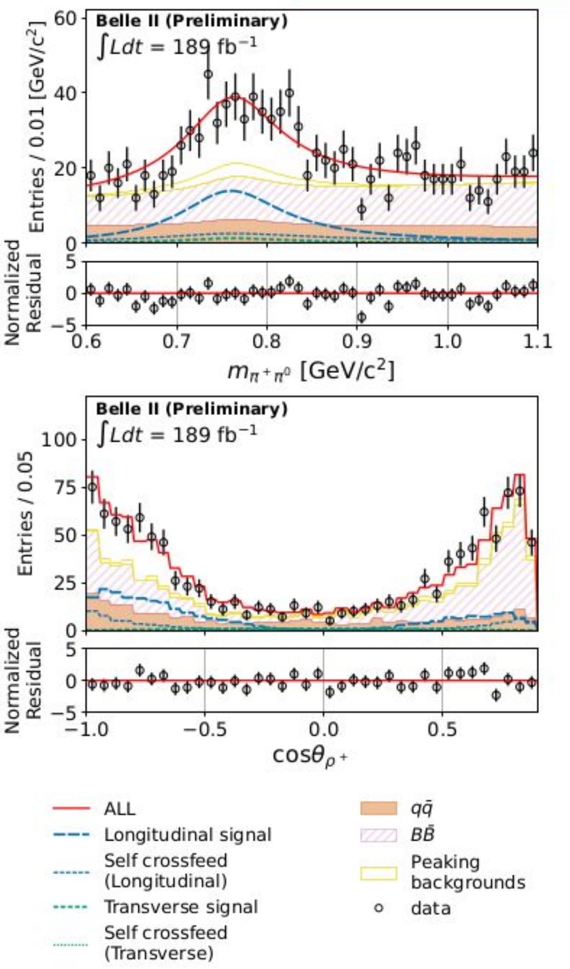
$B^0 \to \rho^+\rho^-$

J. Skorupa @ ICHEP 2022

- Broad resonances of vector mesons, π^0 in final state
- CP analysis requires measurement of longitudinal polarization
- Angular analysis using helicity angles of ρ's
- Fit 6D: ΔE, 2*M($\pi\pi$), 2*helicity angles, $BDT_{cont.supp.}$
- Results:
  - $N(\text{long.}) = 235^{+24}_{-23}$, $N(\text{trans.}) = 21^{+19}_{-17}$

$$\mathcal{B} = (2.67 \pm 0.28 \ \ (\text{stat}) \pm \ 0.28 \ \ (\text{syst})) \cdot 10^{-5}$$
$$f_L = 0.956 \pm 0.035 \ (\text{stat}) \pm 0.033 \ (\text{syst})$$

WA: $\mathcal{B} = (2.77 \pm 0.19) \cdot 10^{-5}$



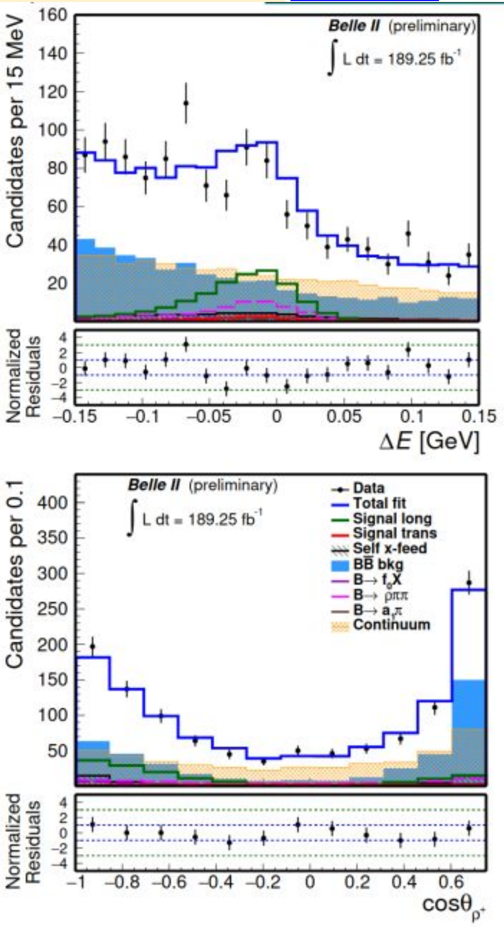
$B^+ \rightarrow \rho^+\rho^0$

arXiv:2206.12362

- Similar to $B^0 \rightarrow \rho^+\rho^-$
- 6D fit: ΔE, BDT, 2*M($\pi\pi$), 2*helicity angles
  - Template fit w/ correlation
- Results:
  - N(sig) = 345 ± 31

$$\mathcal{A}^{CP} = -0.069 \pm 0.068 \text{ (stat)} \pm 0.060 \text{ (syst)}$$
$$\mathcal{B} = (23.2^{+2.2}_{-2.1} \text{ (stat)} \pm 2.7 \text{ (syst)}) \cdot 10^{-6}$$
$$f_L = 0.943^{+0.035}_{-0.033} \text{ (stat)} \pm 0.027 \text{ (syst)}$$

WA: $\mathcal{A}^{CP} = -0.05 \pm 0.05, \mathcal{B} = (24.0 \pm 1.9) \cdot 10^{-6}$



Summary

- Several TDCPV and charmless analysis using a dataset of ~190/fb collected at Belle II presented;

- Complex analyses with many inputs:
  - tracking, neutral reconstruction, Ks, vertexing, Δt resolution modelling, flavour tagging, complex fit, etc

- Belle II has now a dataset comparable to that of BaBar which allows for more and more precise measurements

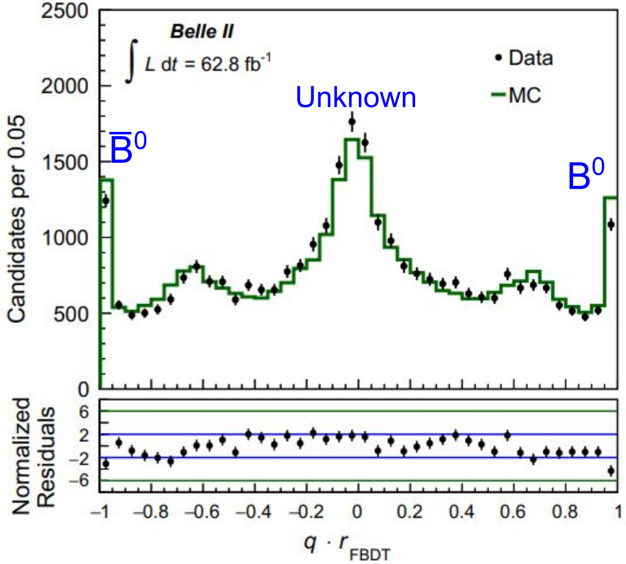
IT'S ACTUALLY ONLY ONE BULLET POINT, BUT IT'S A LONG ONE.

Flavour Tagger

Eur. Phys. J. C 82, 283(2022)

- Used to determine the quark-flavour of B_{tag}
- Many different final states considered, combined with two layers of MVA discriminators.
  - Developed also a **D**eep **N**eural **N**etwork with similar performance



Categories	Targets

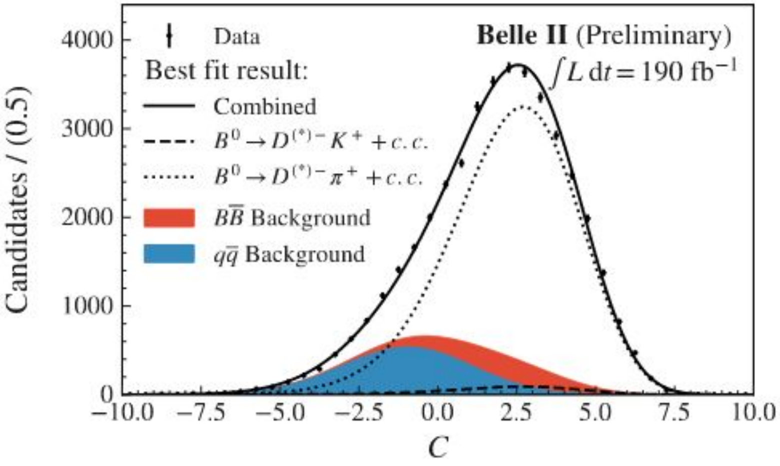
Performance measured on data using B0->D(*)-h+ decays

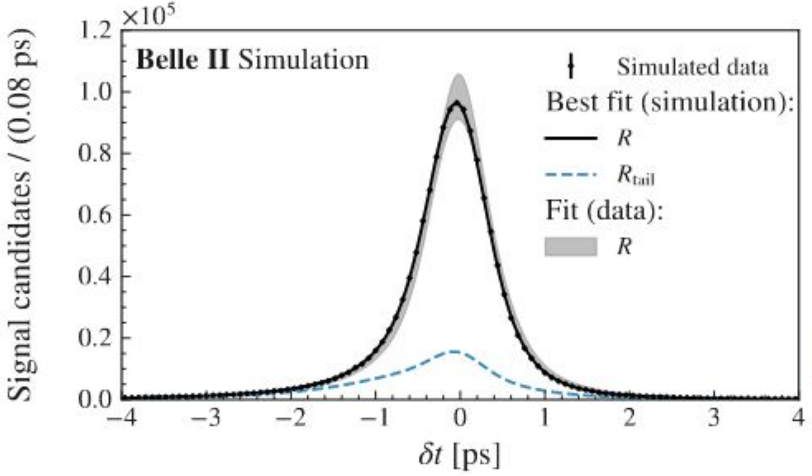
- Effective efficiency:

$$\varepsilon_{eff} = \Sigma_i \varepsilon_i (1 - 2w_i)^2$$
$$= (30.0 \pm 1.2 \pm 0.4)\%$$

B0 lifetime and mixing

$$P(\Delta t, \bar{t}, q, r | \tau_{B^0}, \Delta m_d) = \frac{e^{-2\bar{t}/\tau_{B^0}}}{\tau_{B^0}^2} \times \{1 + q[1 - 2w(r)] \cos(\Delta m_d \Delta t \frac{\hbar}{c^2})\},$$





$$R(\delta t|\sigma_{\Delta t}) = f_G\, G(\delta t|\sigma_{\Delta t}) + f_{\text{tail}}\, R_{\text{tail}}(\delta t|\sigma_{\Delta t}) + f_0\, G_0(\delta t),$$

sin2ϕ1 validation on B+

Exercise and validate procedure on $B^+ \to J/\psi K^+$ decays

1- $B^+ \to D^0 \pi^+$ events from lifetime and mixing measurement used as calibration

2- ΔE distribution of signal events fitted and background subtracted

3- time-dependent fit on signal events performed with all flavor tagger and resolution function parameters fixed from step 1

Cross-checks with $B^+ \to J/\psi K^+$. Calibration done with $B^+ \to D^0 \pi^+$:

$S^{B+}_{CP} = 0.016 \pm 0.029$
$A^{B+}_{CP} = 0.021 \pm 0.021$

Null asymmetries as expected - the analysis is ready

Signal yield: 10028 ± 105

Test of the Isospin Sum Rule ($K\pi$ Puzzle)

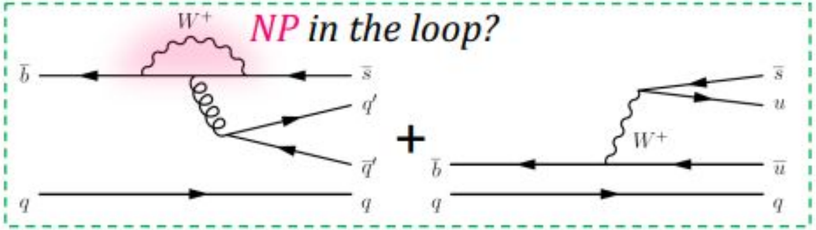
$K\pi$ puzzle

- Isospin relations suggest $\mathcal{A}_{K^+\pi^-} = \mathcal{A}_{K^+\pi^0}$ while the WAs show an 8σ discrepancy
  → called $K\pi$ puzzle.

$\mathcal{A}^{\mathrm{HFLAV}}_{K^+\pi^-} = -0.0836 \pm 0.0032$

$\mathcal{A}^{\mathrm{HFLAV}}_{K^+\pi^0} = +0.029 \pm 0.012$

HFLAV 2022



Isospin rum rule

- The naïve suggestion is modified by an accurate study based on the SM to an identity comprised of all $K\pi$ combinations for $\mathcal{A}_{K\pi}$ and $\mathcal{B}r_{K\pi}$.

$$\mathcal{A}_{K^+\pi^-}\mathcal{B}r(K^+\pi^-)\tau_{B^+} + \mathcal{A}_{K^0\pi^+}\mathcal{B}r(K^0\pi^+)\tau_{B^0} = 2\mathcal{A}_{K^+\pi^0}\mathcal{B}(K^+\pi^0)\tau_{B^0} + 2\mathcal{A}_{K^0\pi^0}\mathcal{B}r(K^0\pi^0)\tau_{B^+}$$

- $\mathcal{A}_{K^0\pi^0}$ dominates the ambiguity of the test. The WAs expects $\mathcal{A}_{K^0\pi^0} = -0.138 \pm 0.025$ while Belle and BaBar only find $\mathcal{A}_{K^0\pi^0} = 0.01 \pm 0.10$.

Previous Belle II results based on $62.8\ \mathrm{fb}^{-1}$
(arXiv:2106.03766, arXiv:2105.04111, arXiv:2104.14871)

Mode	$\mathcal{B}r\ [10^{-6}]$	$\mathcal{A}_{hh}$
$K^+\pi^-$	$18.0 \pm 0.9 \pm 0.9$	$-0.16 \pm 0.05 \pm 0.01$
$K^0\pi^+$	$21.4^{+2.3}_{-2.2} \pm 1.6$	$-0.01 \pm 0.08 \pm 0.05$
$K^+\pi^0$	$5.5^{+1.0}_{-0.9} \pm 0.7$	$-0.09 \pm 0.09 \pm 0.03$
$K^0\pi^0$	$8.5^{+1.7}_{-1.6} \pm 1.2$	$-0.40^{+0.46}_{-0.44} \pm 0.04$

Measurement of ϕ_2/α

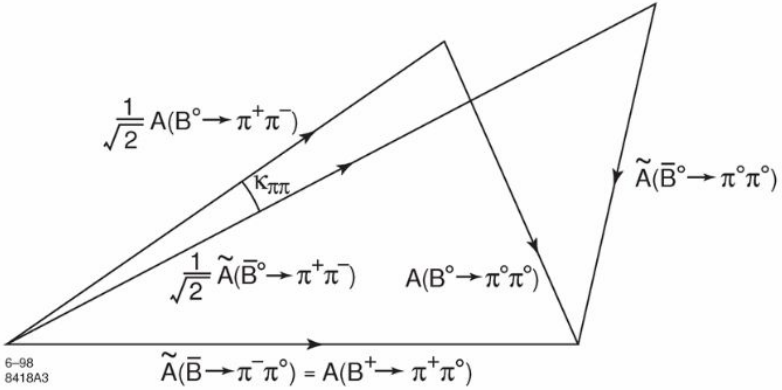
- The measurement of ϕ_2 from $B \to \pi\pi$ (or $B \to \rho\rho$) final states comes from an isospin analysis:

The following equalities hold:

$$\frac{1}{\sqrt{2}}A^{+-} + A^{00} = A^{+0}$$

$$\frac{1}{\sqrt{2}}\tilde{A}^{+-} + \tilde{A}^{00} = \tilde{A}^{+0}$$

$$A^{+0} = \tilde{A}^{+0}$$



- Observables (for e.g. $B \to \pi\pi$):
  - branching fractions of: $B^0 \to \pi^+\pi^0, \pi^+\pi^-, \pi^0\pi^0$;
  - direct (time-independent) CP asymmetries: C^{+-}, C^{00};
  - time-dependent CP asymmetries: S^{+-}, S^{00}.

M. Gronau and D. London, PRL 65 (1990), 3381

- Belle II will be able to measure all these observables;
- We expect to push the sensitivity to α to ~1º.
