

## Towards first $|V_{ub}|$ and $|V_{cb}|$ measurements at Belle II

Mario Merola (Università di Napoli Federico II and INFN) On behalf of the Belle II Collaboration EPS-HEP 2021, July 26-30, 2021

### From KEKB/Belle to SuperKEKB/Belle II

## $|V_{ub}|$ and $|V_{cb}|$ determinations

CKM matrix elements  $|V_{ub}|$  and **V**<sub>cb</sub> probed via semileptonic B

Both CKM matrix elements can be measured via inclusive or exclusive B decays:

•  $|V_{ub}|: B \to X_{u} \ell \nu, B \to \pi(\rho, \eta) \ell \nu$ 

• 
$$|V_{cb}|: B \to X_c \ell \nu, B \to D^{(*)} \ell \nu$$

Belle II physics reach projections summarized in the Belle II Physics Book (PTEP 2019 (2019) 12, 123C01, https://doi.org/10.1093/ptep/ptaa008)

Semileptonic decays:  $B \rightarrow X \ell v$ 

#### Current precision is 1-2% on |V<sub>cb</sub>| and 3-4% on |V<sub>ub</sub>|

- Tension between inclusive and exclusive determinations:  $\sim 3.3\sigma$  for both  $|V_{cb}|$  and  $|V_{ub}|$
- X<sub>c</sub>lv decays are a clear test of the SM LFU: NP (charged Higgs in 2HDM models or Leptoquarks) can affect the BF and |V<sub>cb</sub>|

• Complementary to the R(D)/R(D\*) measurements

$$\mathcal{R}(D^{(*)}) = \frac{\mathcal{B}(\bar{B} \to D^{(*)}\tau^-\bar{\nu}_\tau)}{\mathcal{B}(\bar{B} \to D^{(*)}\ell^-\bar{\nu}_\ell)} \quad (\ell = e, \mu)$$

#### hflav.web.cern.ch

Tagging efficiency (evaluated on Belle MC) @10% purity

• The FEI uses a multivariate technique to reconstruct the B-tag side (semileptonic or hadronic) through O(10<sup>3</sup>) decay modes in a Y(4S) decay.

Tagging Algorithm	Had $B^+/B^0(\%)$	SL B+/B <sup>0</sup> (%)				
Full Reconstruction Belle	0.28/0.18	0.67/0.63				
FEI Belle	0.78/0.46	1.80/2.04				
<b>Belle algorithm:</b> NIM A 654, 432-440 (2011) <b>Belle II FEI:</b> Keck, T., Abudinén, F., z, F.U. et al. Comput Softw Big Sci (2019) 3: 6.						

https://doi.org/10.1007/s41781-019-0021-8

## FEI on Belle II data

- Output of the FEI is a signal probability ( $P_{tag}$ ) between 0 (misreconstructed) and 1 (properly reconstructed)  $B_{tag}$  candidate.
- Tag side reconstructed in hadronic modes

$$M_{bc} = \sqrt{s/4 - (p_B^*)^2}$$

- Look for signal side lepton with momentum (in  $B_{sig}$  rest frame) > 1 GeV/c
- Check consistency with the well-known  $B \to X \ell \nu$
- Used to calibrate FEI

Inclusive  $B \rightarrow X_{\mu} \ell \nu$ 

#### • Challenging due to the dominant $b \rightarrow clv$ background

- Exploit the lepton momentum endpoint where the  $b \rightarrow c$  component becomes negligible
- Identify one electron with particle identification criteria
- Suppress  $q\bar{q}$  background with multi-variate algorithm, exploiting event shape variables

Charged Lepton *p*<sub>l</sub> Momentum

First observation at  $\sim 3\sigma$  level

Exclusive  $B \rightarrow \pi \ell \nu$ 

arXiv:2008.08819

arXiv:2102.07233

PRD 91, 074510 (2015)

Measurement in bins of  $q^2$  used to extract  $|V_{ub}|$ 

$$\frac{d\Gamma}{dq^2} = \frac{G_F^2 |V_{ub}|^2}{24\pi^3} |p_\pi|^3 |f_+(q^2)|^2 \quad \text{Form factors } f \text{ computed with} \\ \text{LQCD (high } q^2) \text{ or LCSR } (q^2 \le 0)$$

# **FEI hadronic tagged** analysis (untagged analysis in progress)

- Exploits missing energy and extra energy in the calorimeter
- Fit to  $M_{miss}^2$  distribution to measure the BF

$$M_{\text{miss}}^2 \equiv p_{\text{miss}}^2 = (p_{B_{\text{sig}}} - p_Y)^2 \frac{\text{Y is the}}{\pi \ell}$$
 system

 $\mathcal{B}(B^0 \to \pi^- \ell^+ \nu_\ell) \left| (1.58 \pm 0.43_{\text{stat}} \pm 0.07_{\text{sys}}) \times 10^{-4} \right|$ 

**Belle II Preliminary**  $\int \mathcal{L} dt = 34.6 \, \text{fb}^{-1}$ 

Observation with significance  $> 5\sigma$ 

## $|V_{ub}|$ projections

- Projection of  $|V_{ub}|$  uncertainties from  $B^0 \rightarrow \pi \ell \nu$  decay
- Takes advantage from improvements in LQCD

 Precision of ~1% with full Belle II dataset

Belle Ti

Vub  uncert.	Belle II (5 ab <sup>-1</sup> )	Belle II (50 ab <sup>-1</sup> )
Exclusive	(1.2 ⊕1.7)%	(0.9 $\oplus$ 0.9)%
Inclusive	(2.3 $\oplus$ 2.5-4.5)%	(1.7 $\oplus$ 2.5-4.5)%

Projected errors: (experiment  $\oplus$  theory)

Inclusive  $B \rightarrow X_c \ell \nu$ 

#### JHEP02(2019)177

• Total decay rate expressed as expansion of non-perturbative matrix elements (heavy quark expansion, HQE)

$$\Gamma = \frac{G_F^2 m_b^5}{192\pi^2} |V_{cb}|^2 \left( 1 + \frac{c_5(\mu) \langle O_5 \rangle(\mu)}{m_b^2} + \frac{c_6(\mu) \langle O_6 \rangle(\mu)}{m_b^3} + \mathcal{O}\left(\frac{1}{m_b^4}\right) \right)$$

- Measure the **spectral moments** (moments of lepton energy or hadronic mass) in order to simultaneously determine the non perturbative elements and  $|V_{cb}|$  (see Kevin Olschewsky's <u>talk</u> for the determination using q<sup>2</sup> moments)
- Belle II performed both the **untagged** and the **hadronic tagged** analyses

#### Untagged analysis

- Require one well identified lepton
- Exploit missing mass and momentum to reject backgrounds
- Measure the BF with a fit to  $p^*$

 $\mathcal{B}(B \to X_c \ell \nu) = (9.75 \pm 0.03(stat) \pm 0.47(syst))\%$ 

(average of muon and electron channels)

Main uncertainty is the knowledge of  $B \rightarrow X_c \ell \nu$  branching fractions

#### Tagged analysis

arXiv:2009.04493

BABAR-CONF-07/003,

Phys. Rev. D 75, 032005, 2007

• Measure the hadronic mass moments

- Main systematics: knowledge of  $B \rightarrow X_c \ell \nu$  composition and bias correction ( $C_{true}$ )
- $|V_{cb}|$  determination from q<sup>2</sup> moments in progress

Exclusive  $B \rightarrow D^{(*)} \ell \nu$ 

arXiv:2008.10299

- FEI hadronic tagged and untagged approaches explored
- Decays reconstructed in the channels  $D^{*+} \rightarrow D^0 \pi_s^+$ ,  $D^0 \rightarrow K \pi$

- Tagged analysis  $(\bar{B}^0 \to D^{*+} \ell^- \bar{\nu})$ 
  - Almost background free after tag and signal selection  $(D^*, D^0 \text{ invariant masses}, p_l^* > 1 \text{GeV})$

$$\mathcal{B}(\overline{B}^0 \to D^{*+} \ell^- \overline{\nu}_l) = \left(4.51 \pm 0.41_{\text{stat}} \pm 0.27_{\text{syst}} \pm 0.45_{\pi_s}\right)\%$$

- Main systematics: tracking of  $\pi_s$  and MC modelling
- In agreement with world average

 $\mathcal{B}(\bar{B}^0 \rightarrow D^{*+} \ell \nu_\ell) = (5.05 \pm 0.14) \,\%$ 

Exclusive  $B \rightarrow D^{(*)} \ell \nu$ 

#### **Untagged** analysis

•  $\theta_{BY}$  angle between the B flight direction and the direction of the D\* $\ell$ or D<sup>0</sup> $\ell$  system (Y):

$$\cos \theta_{BY} = \frac{2E_B^* E_Y^* - M_B^2 - m_Y^2}{2p_B^* p_Y^*}$$

• Fit to  $\cos\theta_{BY}$  distribution in data to measure the branching fraction

#### **Belle II preliminary** $\int \mathcal{L} dt = 34.6 \, \text{fb}^{-1}$ 5000 Events / (0.53 $B^0 \rightarrow D^* e v$ BB background Continuum E Data 4000 III MC unc. 3000 2000 1000 COSORY $\mathcal{B}(\overline{B}^0 \to D^{*+} \ell^- \overline{\nu}_l) = (4.60 \pm 0.05_{\text{stat}} \pm 0.17_{\text{syst}} \pm 0.45_{\pi_s})\%$ $\mathcal{B}(B^- \to D^0 \ell^- \overline{\nu}_l) = (2.29 \pm 0.05_{\text{stat}} \pm 0.08_{\text{syst}})\%$ (average of muon and electron channels)

#### consistent with the SM within $1\sigma$

In progress: extraction of  $|V_{cb}|$  from partial branching fractions in bins of hadron recoil parameter spectrum

#### BELLE2-CONF-PH-2020-008

- Within the next years Belle II will be able to address the inclusive/exclusive  $|V_{cb}|/|V_{ub}|$  tension by precisely measuring semileptonic B decays with missing energy
- With about 1/4 of the current dataset, Belle II has been able to measure extensively inclusive and exclusive semileptonic B decays, adopting untagged approaches and exploiting the Full Event Interpretation algorithm for tagged analyses

Channel	Result presented in the talk	V <sub>xb</sub>   measurement in progress
$B\to X_u\ell\nu$	$3\sigma$ observation (untagged)	
$B^0 \to \pi^- \ell \nu$	$BF = (1.58 \pm 0.43_{stat} \pm 0.07_{syst}) \times 10^{-4}$ (FEI hadronic)	$ V_{ub} $ from partial branching fraction in $q^2$ bins
$B \to X_c \ell \nu$	$BF = (9.75 \pm 0.03_{stat} \pm 0.47_{syst})\%$ (untagged) Hadronic mass moments (FEI hadronic)	$ V_{cb} $ from $q^2$ spectral moments (novel approach)
$\bar{B}^0 \to D^{*+} \ell^- \nu$	$BF = (4.60 \pm 0.05_{stat} \pm 0.48_{syst})\% \text{ (untagged)}$ $BF = (4.51 \pm 0.41_{stat} \pm 0.52_{syst})\% \text{ (FEI hadronic)}$	$ V_{cb} $ from partial branching fractions in hadronic recoil
$B^- \to D^0 \ell^- \nu$	$BF = (2.29 \pm 0.05_{stat} \pm 0.08_{syst})\%$ (untagged)	parameter bins

## Thanks !

Summary <u>talk</u> on highlights from Belle II experiment by Carsten Niebuhr on Friday

- FEI Calibration (17)
- B  $\rightarrow \pi l \nu$  decay (18-19)
- $B \rightarrow X_c lv untagged (20)$
- $B \rightarrow X_c lv$  hadronic mass moments(21-22)
- $B \rightarrow D^* l\nu$  and  $|V_{cb}|$  (23)
- $B \rightarrow D^{(*)} l \nu$  (24)
- $R(D), R(D^*)$  (25)

### Hadronic mass moments from $B \rightarrow X_c \ell v$

arXiv:2009.04493

$$\langle M_X^n \rangle = \frac{\sum_i w_i(M_X) M_{X,\text{calib}i}^n}{\sum_i w_i(M_X)} \times \mathcal{C}_{\text{calib}} \times \mathcal{C}_{\text{true}}$$

$$M_{X,\text{calib}}^{n} = \frac{M_{X}^{n} - c(E_{\text{miss}} - p_{\text{miss}}, X_{\text{mult}}, p_{\ell}^{*})}{m(E_{\text{miss}} - p_{\text{miss}}, X_{\text{mult}}, p_{\ell}^{*})}$$

- *w* is the event-wise signal probability (obtained from background subtracted data)
- $C_{calib}$  is a correction for the calibration bias and is obtained with the ratio of true generated and calibrated moments  $C_{calib} = \langle M_{X,true}^n \rangle / \langle M_{X,calib}^n \rangle$
- $C_{true}$  is a correction for reconstruction and detector acceptance and is the ratio of generated moments without and with event selection applied  $C_{true} = \langle M_{X,true,signal}^n \rangle / \langle M_{X,true}^n \rangle$

TABLE IV: Summary of statistical and systematic uncertainties for the measurement of  $\langle M_X^2 \rangle$ . All values are given in  $(\text{GeV}/c1)^2$  if not stated otherwise. The calculation of the uncertainties is described in Section 5.5.2.

## |V<sub>cb</sub>| from D\*lnu

## D\*lnu and Dlnu

Source	Relative uncertainty (%)		
	$\overline{B}{}^0 \to D^{*+} e^- \overline{\nu}_e$	$\overline{B}{}^0 \to D^{*+} \mu^- \overline{\nu}_{\mu}$	
PDF shape uncertainties	0.7	0.6	
$\mathcal{B}(\bar{B} \to D^{**}\ell\bar{\nu})$	0.1	< 0.1	
Lepton-ID	0.4	1.9	
MC statistics, efficiency	< 0.1	< 0.1	
Tracking of $K, \pi, \ell$	2.4	2.4	
Tracking of $\pi_s$	9.9	9.9	
$N_{B^0}$	2.0	2.0	
Charm branching fractions	1.1	1.1	
$\overline B{}^0\to D^{*+}\ell^-\overline\nu_l$ Form Factors	1.1	1.1	
Total	10.5	10.7	

	Relative uncertainty [%]			
Source	$B^- \to D^0 e^- \overline{\nu}_e$	$B^- \to D^0 \mu^- \overline{\nu}_\mu$		
$N_{B^{\pm}}$	1.61	1.61		
$\mathcal{B}(D^0\to K^-\pi^+)$	0.78	0.78		
Tracking	2.07	2.07		
Lepton identification	1.41	2.38		
MC efficiency (statistical)	0.09	0.09		
$D\ell\nu$ form-factor	0.15	0.15		
$D^*\ell\nu$ form-factor	0.44	0.44		
Continuum shape	0.37	0.37		
Sum	3.14	3.68		

 $R(D), R(D^*)$ 

Main systematics:  $D^{**}$  modelling, soft pions, yield of fake  $D^*$  candidates. Studies of  $B \rightarrow D^{**}lv$  and  $B \rightarrow D^{**}\tau v$  planned

Belle II 50 ab-1
