

# CKM and CPV: Experimental Overview

Doris Yangsoo Kim  
Soongsil University

August 5, 2020

ICHEP 2020 (Virtual Conference / Prague, Czech Republic)

# Contents

- CKM
  - Status of CKM angle  $\gamma$
  - $V_{xy}$  from (semi)-leptonic decays
- CPV
  - CPV phase  $\phi_s$  in  $B_s$  mixing
  - Time dependent analyses
- News from Belle II
- Summary

## Disclaimer:

There is an enormous variety of interesting topics on CKM/CPV.  
Given the time constraint, only selected subjects are summarized.

# CKM

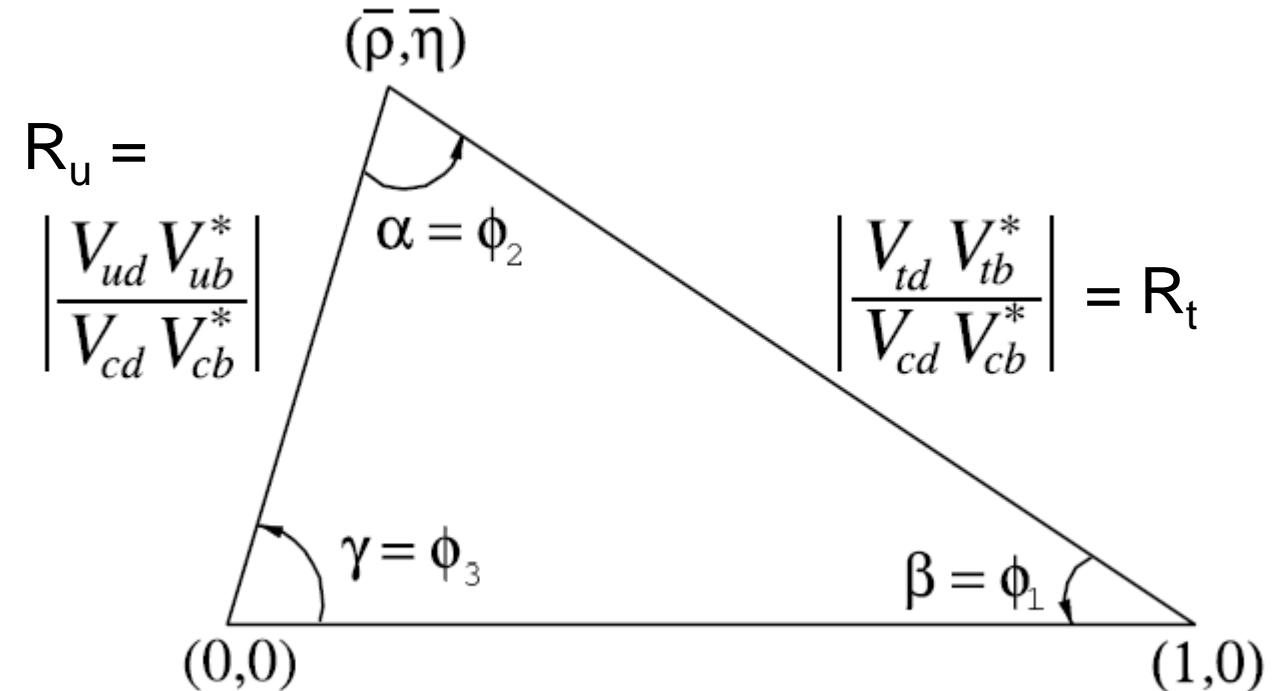

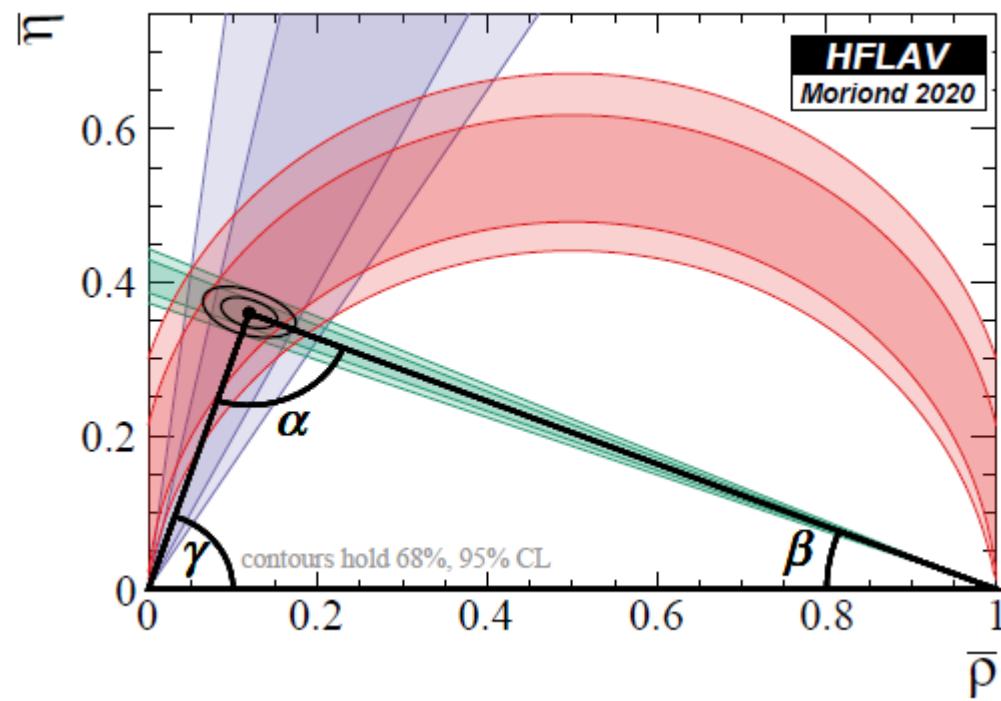

Figure 12.1: Sketch of the unitarity triangle.

Prog. Theor. Exp. Phys. 2020 083C01 (2020)  
aka PDG 2020

# Current Status of CKM Angles

$$\alpha = 84.9_{-4.5}^{+5.1}, \quad \beta = 22.2 \pm 0.7, \quad \gamma = 72.1_{-4.5}^{+4.1} \text{ deg}$$

Prog. Theor. Exp. Phys. 2020 083C01  
(2020)

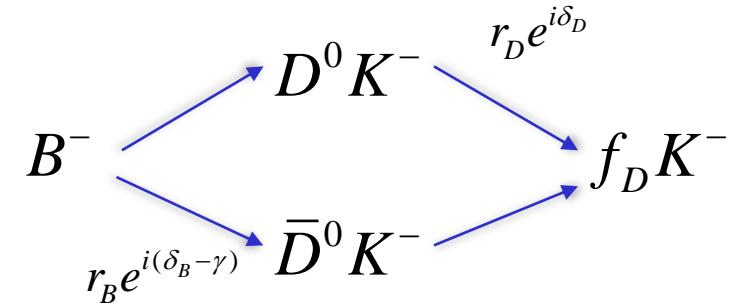

- The measurement on  $\gamma$  has been improved nicely with LHCb data. However,
  - Direct measurement at tree level:
$$\gamma = 72.1_{-4.5}^{+4.1} \text{ deg}$$
  - Indirect calculation at loop level:
$$\gamma = 65.66_{-2.65}^{+0.9} \text{ deg}$$
  
(CKMFitter 2019 summer)
  - There is a  $2\sigma$  tension between the values, which could be an indication for New Physics.

# The CKM Angle $\gamma$

$$\gamma = \phi_3 = \arg \left( \frac{-V_{ud} V_{ub}^*}{V_{cd} V_{cb}^*} \right)$$

- $\gamma$  can be measured with a very small theoretical error.
  - Calculable at the tree level as an interference between “b to u” and “b to c”.

$\delta\gamma / \gamma \approx O(10^{-7})$  Brod & Zupan, JHEP01, 051 (2014).

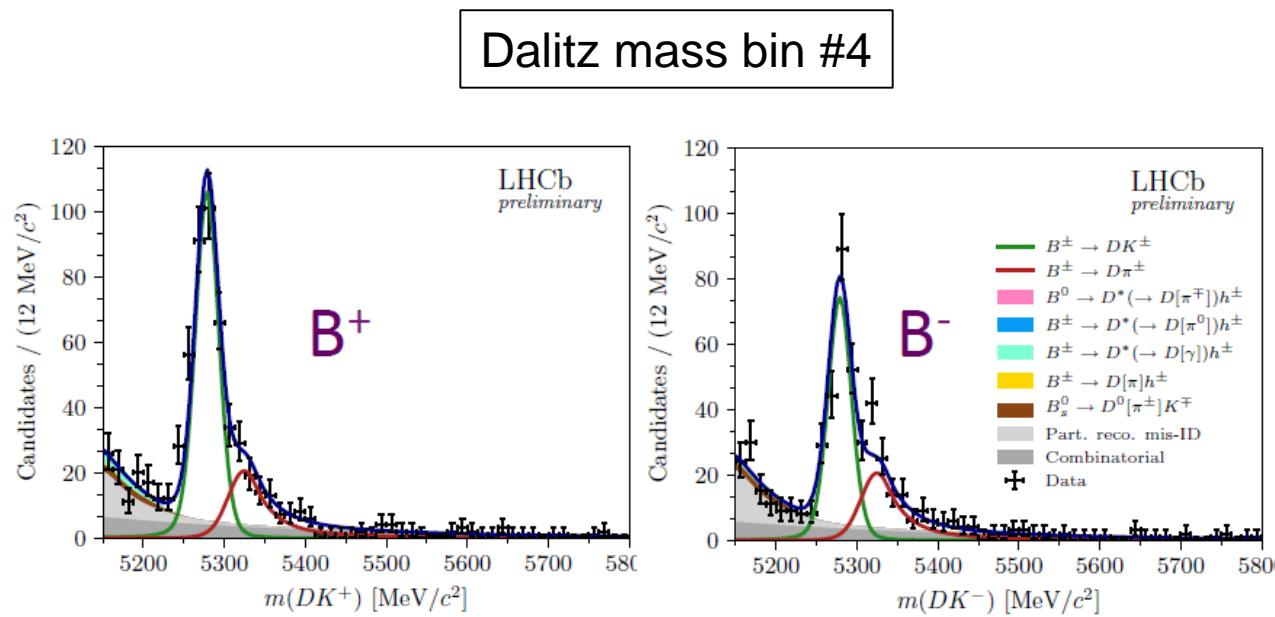

- Experimentally, not so simple:
  - Uses hadronic B decay channels with small branching fractions; sizable LHCb data sets incredibly useful.
  - Modes involving neutrals need Belle (II) data.
  - Analyses need inputs from other beauty and charm experiments (CLEO-c, BES III)
  - Strategy: Measure  $\gamma$  from many D decay channels and combine them.

# Testing $B \rightarrow Dh'$ with $D \rightarrow K_S^0 hh$ , $h = K, \pi$

- LHCb is studying various  $B \rightarrow Dh'$  combinations with full Run 1 and Run 2 data.
- An example: BPGGSZ (D to 3 body final states) analysis on  $D \rightarrow K_S^0 \pi^+ \pi^-$  and  $D \rightarrow K_S^0 K^+ K^-$ .
  - $B^+$  and  $B^-$  yields are compared for each Dalitz mass bin of  $D$ , resulting in asymmetry.

preliminary

<https://cds.cern.ch/record/2725936>

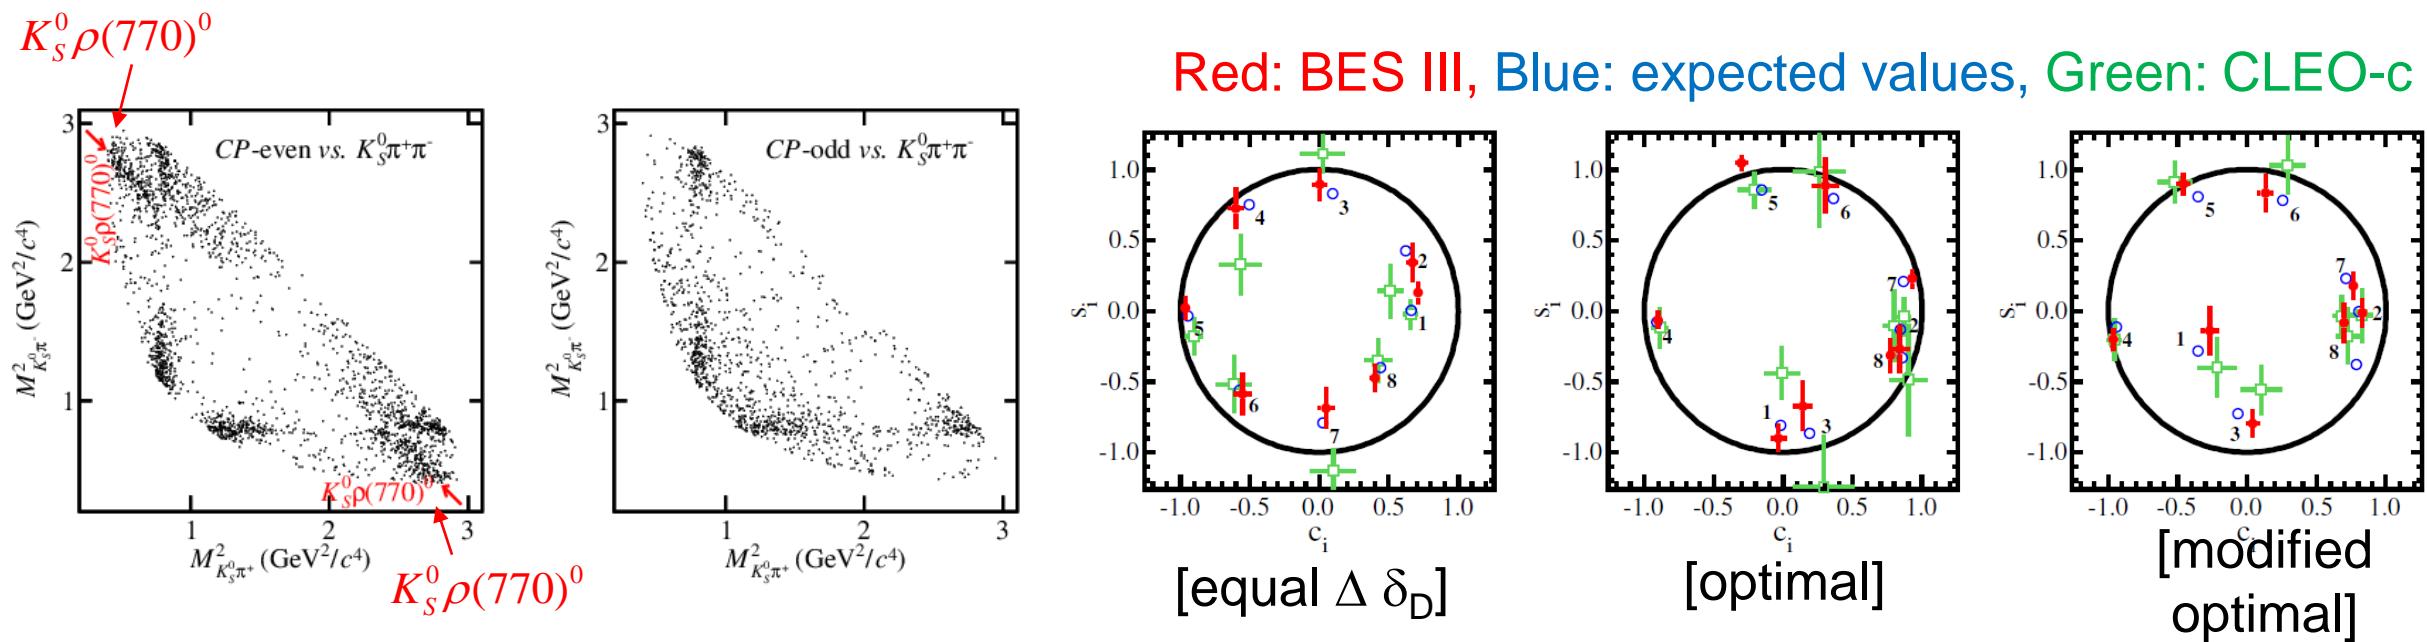

Preliminary LHCb  $\gamma = (69 \pm 5)$  deg  
with uncertainty  $\sim 5(\text{stat}) \sim 1(\text{sys}) \sim 1(\text{ext})$  deg

- CPV is observed clearly in  $B \rightarrow DK$ .
- This preliminary result is the most precise single measurement on  $\gamma$ .  
**(Talk Malde, July 30<sup>th</sup>)**
- The last uncertainty is from  $\delta_D$  (next slide)

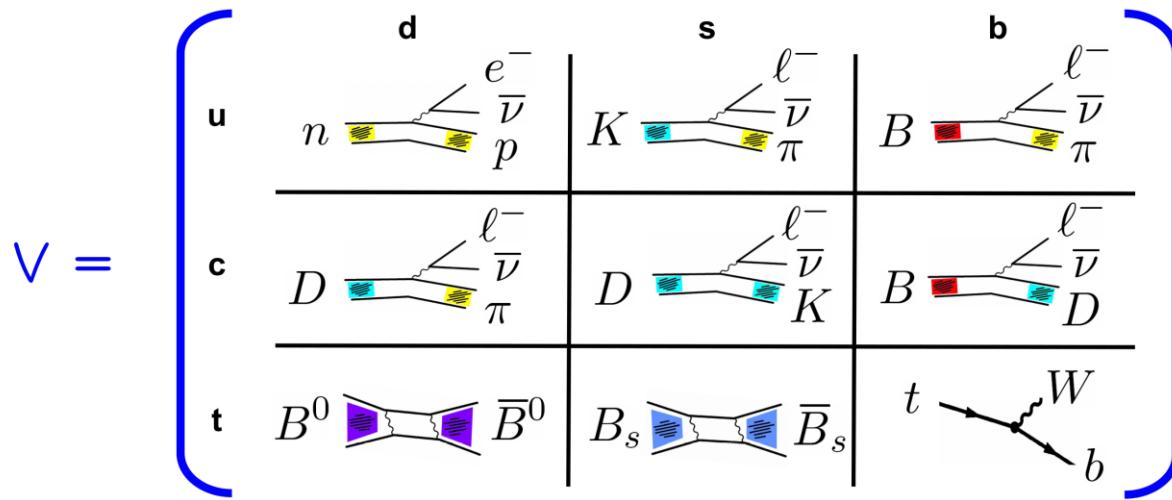

Previous LHCb:  $\gamma = (80^{+10}_{-9})$  deg  
with uncertainty  $\sim 9(\text{stat}) \sim 3(\text{sys}) \sim 4(\text{ext})$  deg

# Measurement of Strong Phase $\delta_D$

- Charm factories (CLEO-c, BES III) running at  $\psi(3770)$  create C- odd  $D\bar{D}$  pairs (Quantum correlation).
  - If tag side  $\bar{D}$  is CP odd, then signal side  $D$  is CP even. And vice versa.
- BES III conducted Dalitz analysis of  $D \rightarrow K_{S,L}^0 \pi^+ \pi^-$  and measured  $\delta_D$ . Phys. Rev. Lett. 124, 241802 (2020), Phys. Rev. D 101, 112002 (2020).
  - The associated uncertainty on  $\gamma$  is reduced from  $\sim 3$  to  $\sim 1$  deg. (Talk Lin, July 28<sup>th</sup>)

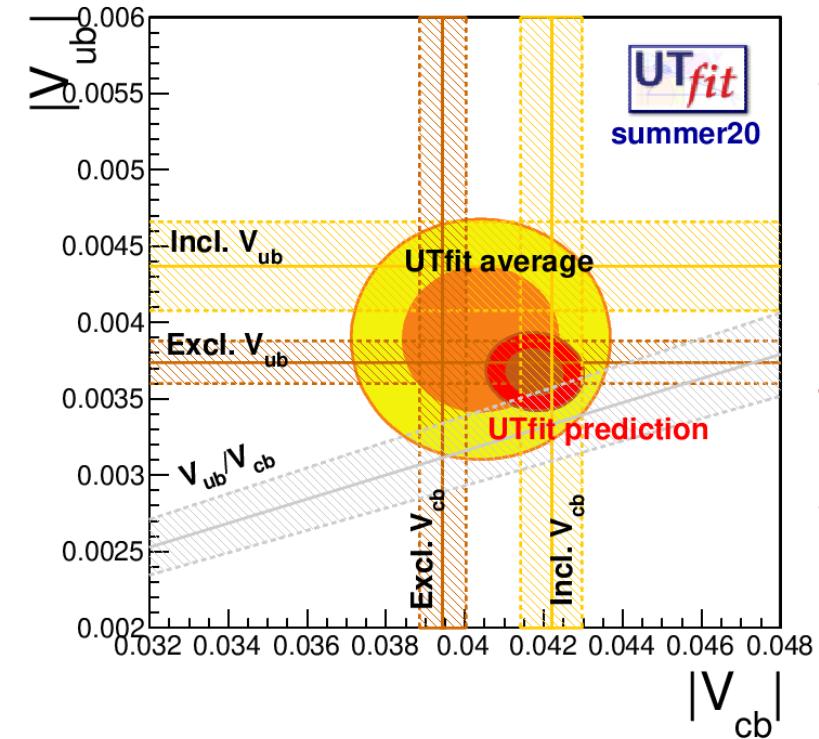

# (Semi)-Leptonic Decays

- Semi-leptonic decay rates are described as

$$\frac{d\Gamma(B \rightarrow h_x l \bar{\nu})}{dq^2 d\Omega} \propto |V_{xb}|^2 \times FF_{B \rightarrow h_x}(q^2, \Omega)$$

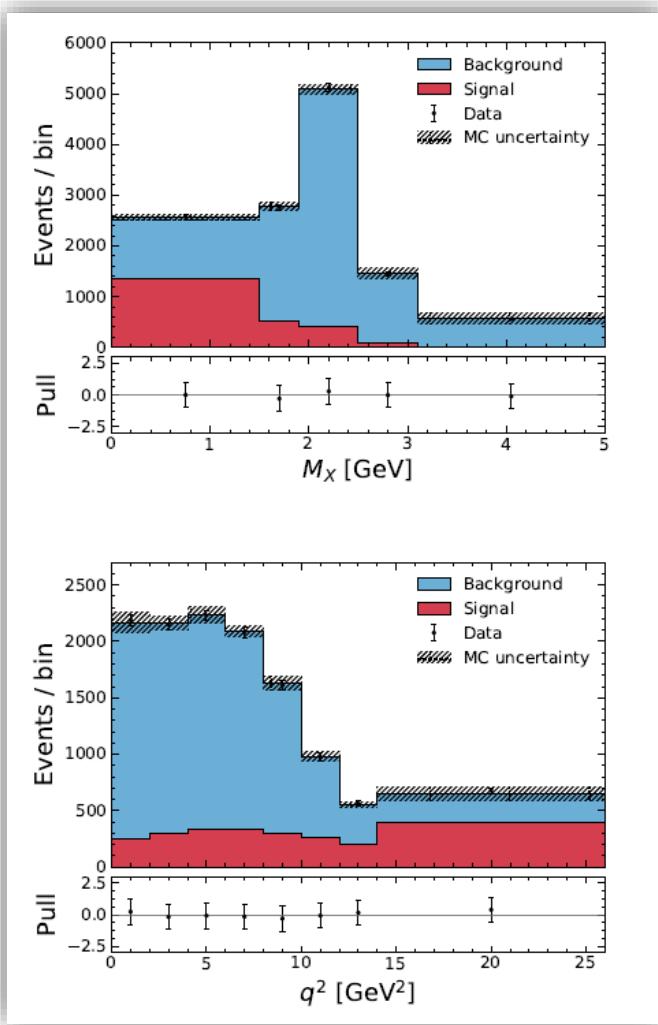

- The measurement of  $h_x$  final states gives additional kinematic information, such as angles.
- Form factors, which represent hadronic interactions, need inputs from LQCD, light cone, etc.

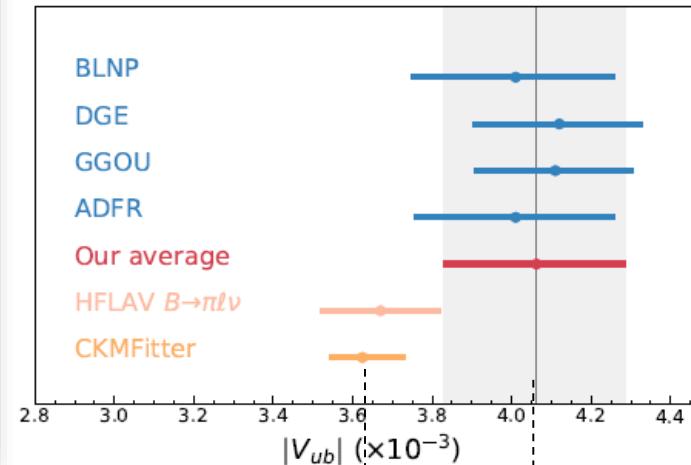

Historically,  $V_{xb}$  measurements using **exclusive** and **inclusive** approaches did not agree very well, leading to speculations regarding new physics from e.g. right-handed currents.

# $V_{ub}$ : Inclusive Measurement

preliminary

- Cabibbo favored  $B \rightarrow X_c l \nu$  is a major background to CKM suppressed  $B \rightarrow X_u l \nu$ .
- Lepton energy endpoint and/or low  $M_x$  regions give clear info on  $B \rightarrow X_u l \nu$ .
- The new Belle analysis used neural network for hadronic tagging of the other B. Machine learning (BDT) is used to suppress backgrounds such as  $X_c l \nu$ .

From the 2-d fit on  $q^2$  and  $M_x$  with  $E_l > 1.0$  GeV, Belle obtained a preliminary result of

$$|V_{ub}| = (4.06 \pm 0.09 \pm 0.16 \pm 0.15) \times 10^{-3}.$$

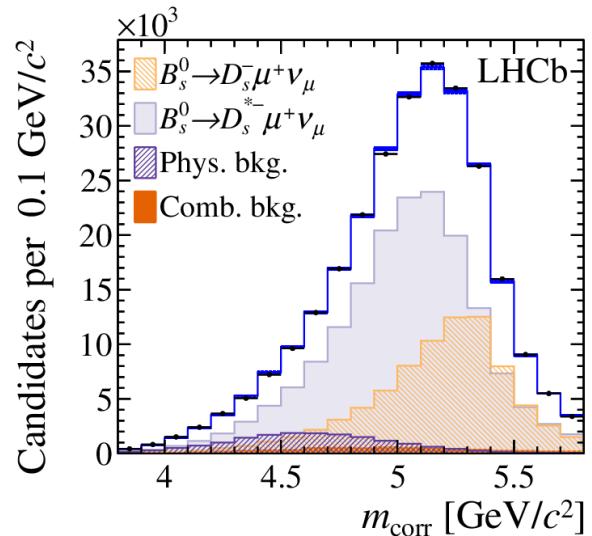

(last uncertainty theoretical)  
(Talk Cao, July 30<sup>th</sup>)

# $V_{cb}$ : Exclusive Measurement

- $B \rightarrow D^{(*)} l \nu$  is studied extensively to obtain exclusive  $V_{cb}$ .
- Fit variable  $\omega$  + Full angular analysis strategy is used.

$$\omega = \frac{m_B^2 + m_D^2 - q^2}{2m_B m_D}, \quad z = \frac{\sqrt{\omega+1} - \sqrt{2}}{\sqrt{\omega+1} + \sqrt{2}}$$

- Note that uncertainty in form factors and  $F(1)$  should be considered.

# $\tan \theta_c$ and Isospin: Old Issue but New Result

- BES III measured DCS BF  $D^+ \rightarrow K^+ \pi^+ \pi^- \pi^0$  by reconstructing double tag events. arXiv:2007.07674. This world first measurement provides the ratio of DCS/CF BRs, which is related to  $\tan \theta_c$  as,

$$\frac{B(D \rightarrow K^+ \pi^+ \pi^- \pi^0)}{B(D \rightarrow K^- \pi^+ \pi^- \pi^0)} = (1.81 \pm 0.15)\% = (6.28 \pm 0.52) \tan^4 \theta_c$$

- This value is much larger compared to the other DCS/CF ratios. There may be a large isospin violation between  $D^+ \rightarrow K^+ \pi^+ \pi^- \pi^0$  and  $D^0 \rightarrow K^+ \pi^- \pi^- \pi^+$ .
- There was no clear evidence of CPV in the charge asymmetry measurement.

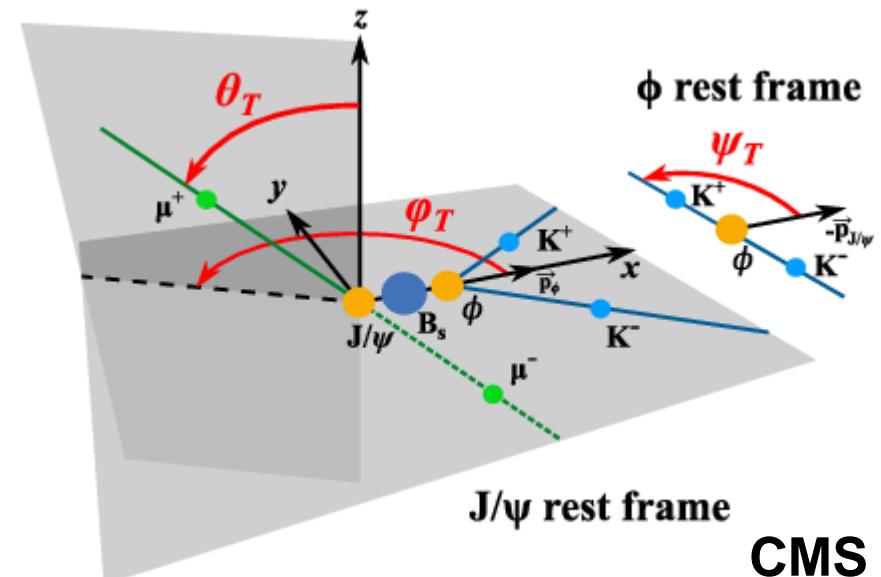

# CPV

# CPV phase $\phi_s$ in $B_s$ mixing

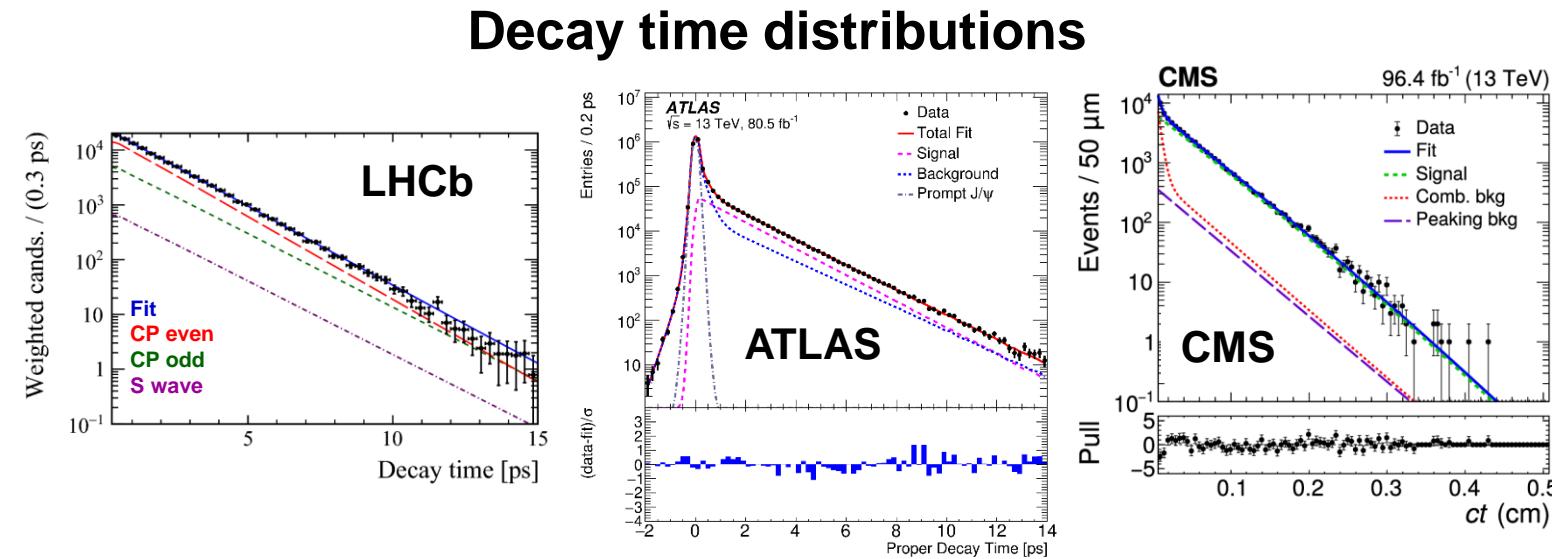

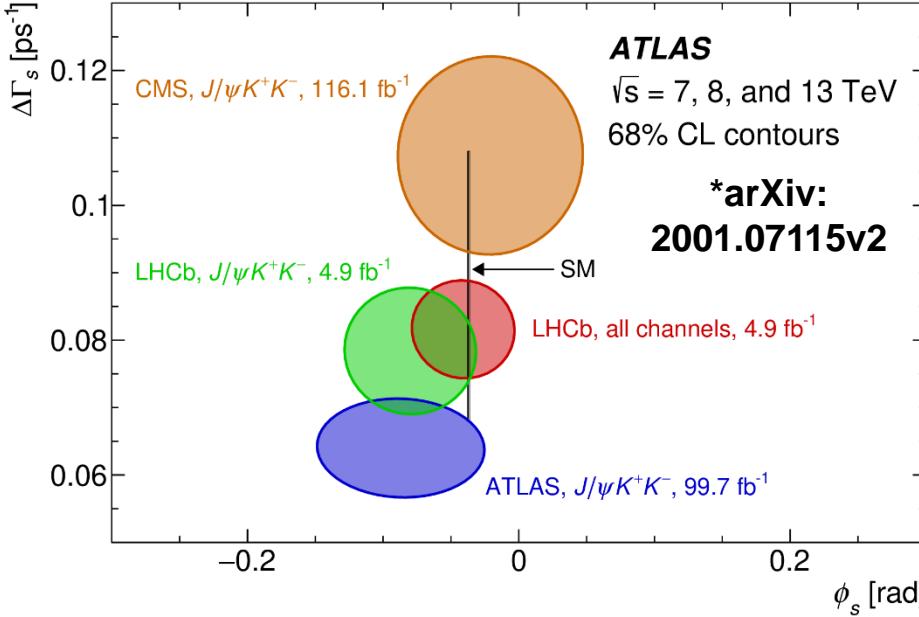

- $\phi_s$  is a CPV phase, which is a weak phase difference between the  $B_s - \bar{B}_s$  mixing and the direct decay of  $B_s$  into a common final state.
- The golden mixing decay  $B_s \rightarrow J/\psi \phi$ , ( $\phi \rightarrow K^+ K^-$ ) is well known, less complicated environment to measure the phase. (No direct CPV. Only one weak phase.)
- At the tree level, SM predicts

$$\phi_s \approx -2\beta_s = -2 \arg \left( \frac{-V_{ts} V_{tb}^*}{V_{cs} V_{cb}^*} \right)$$

- At LHC experiments, the flavor of  $B_s$  is determined by Opposite Side Tagging (muon, electron, jet-charge) or Same Side Tagging (Kaon, LHCb only).

# Time Dependent CPV in $B \rightarrow D^{*\pm}D^{\mp}$

- In the  $B \rightarrow D^{*\pm}D^{\mp}$  decays, in addition to the CKM angle  $2\beta$ , New Physics contributions may appear.
  - Recent LHCb results, JHEP 03, 147 (2020), are comparable to the previous Belle/Babar numbers, and are the most precise up to date.
  - Used modes are  $D^{*+} \rightarrow D^0\pi^+$  ( $D^0 \rightarrow K^-\pi^+\pi^+\pi^-$ ,  $D^0 \rightarrow K^-\pi^+$ ) and  $D^- \rightarrow K^+\pi^-\pi^-$ .

(Talk Gersabeck, July 29<sup>th</sup>)

# Update of Charm mixing/CPV: ICHEP 2020

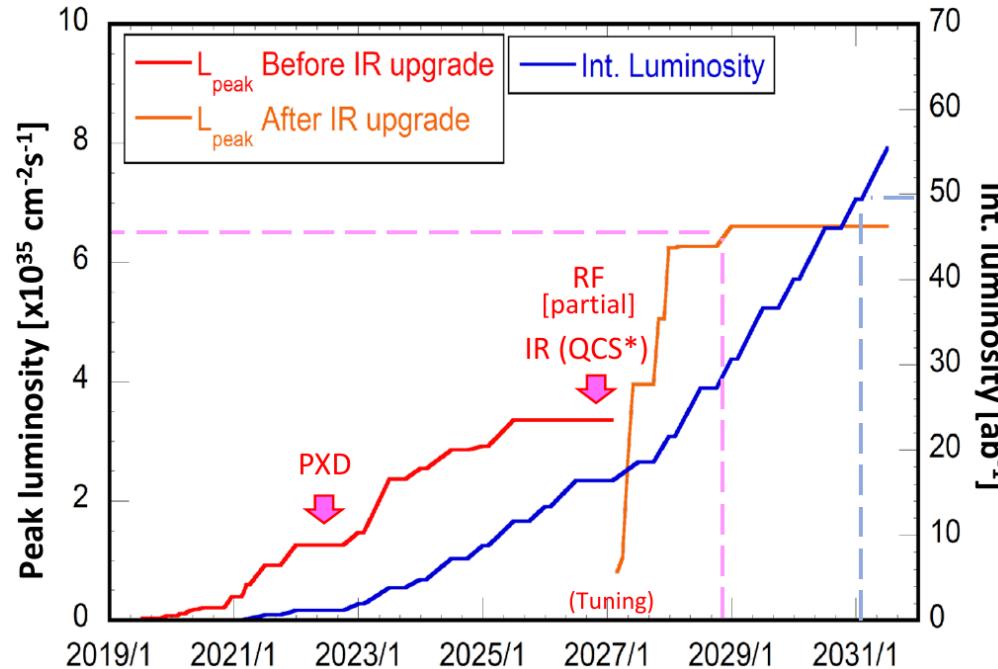

- HFLAV updated the charm sector as <https://hflav.web.cern.ch/content/charm-physics>

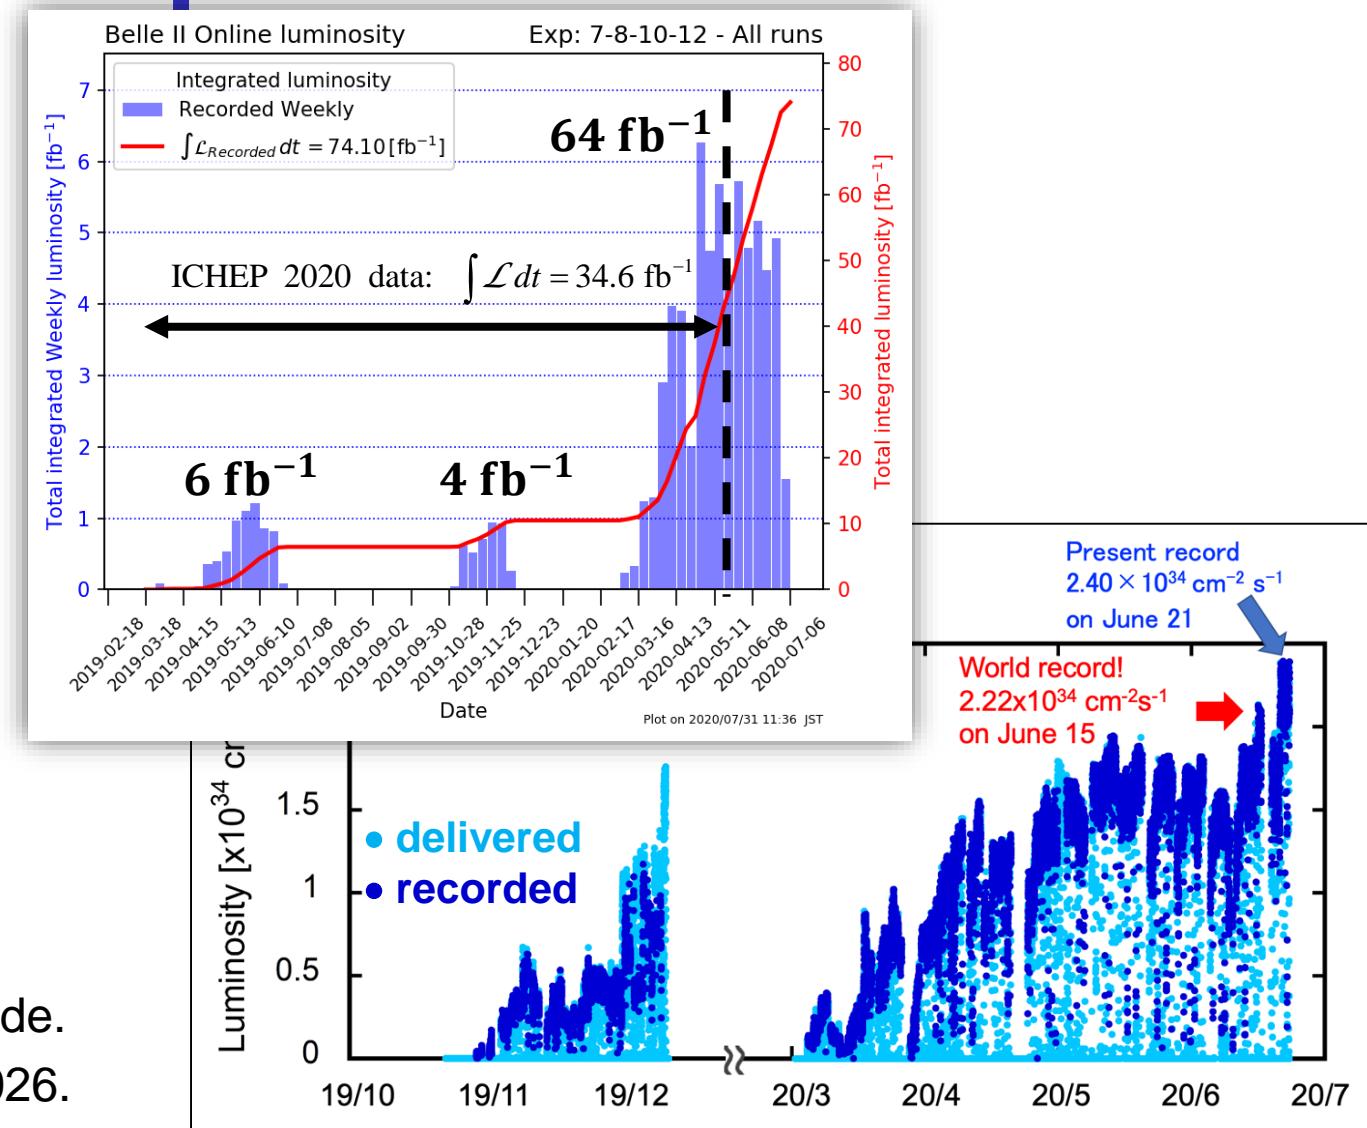

LHCb  $D^0 \rightarrow K^+K^-$ ,  $D^0 \rightarrow \pi^+\pi^-$  Phys. Rev. D 101, 012005 (2020) (Talk Tuci, July 30<sup>th</sup>)

# **NEWS FROM BELLE II**

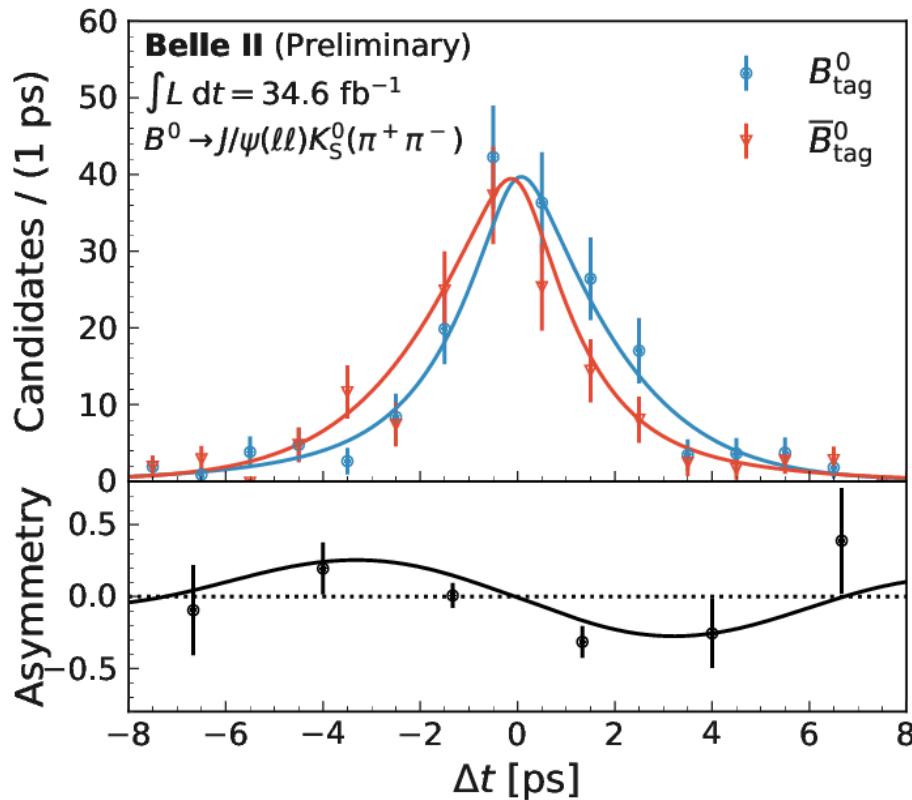

# Belle II Luminosity: Proposed Plan and Status

- In general, 8 months running per year.
- 2021-2022: PXD exchange.
- 2026: Partial RF-power upgrade. IR upgrade.
- $\beta_y^* \sim 0.5 \text{ mm}$  before 2026.  $0.3 \text{ mm}$  after 2026.

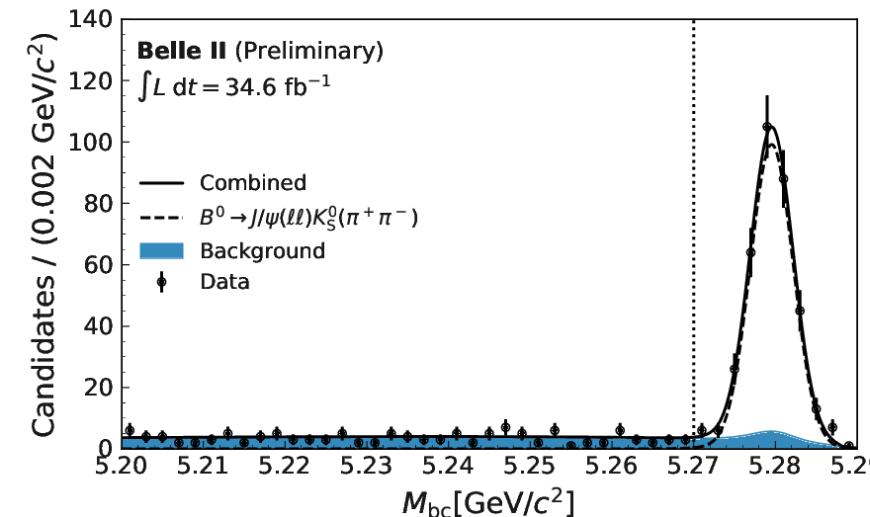

# Time Dependent CPV and Mixing

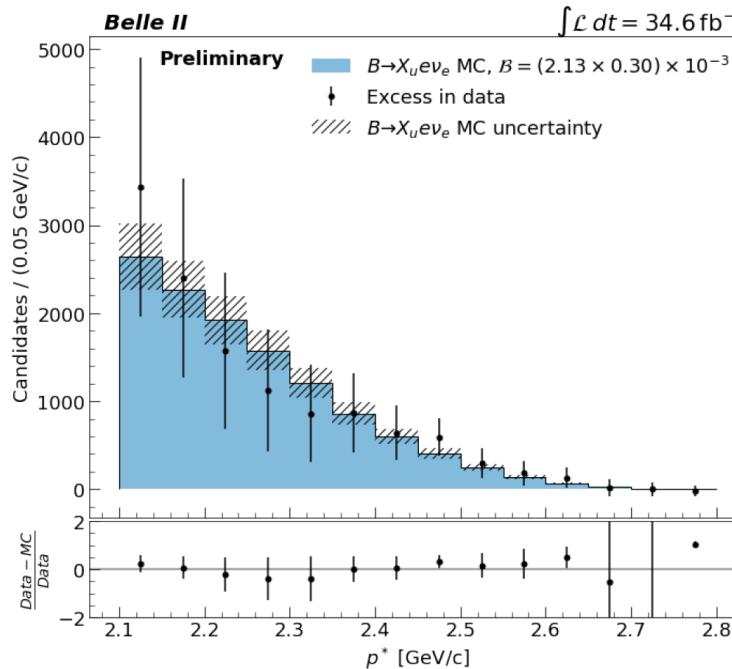

Belle II:  $S_f \approx \sin 2\phi_1 = 0.55 \pm 0.21 \pm 0.04$ .  
 W. A.:  $S_f \approx 0.691 \pm 0.017$ .

- The golden channel  $B^0 \rightarrow J/\psi(l\bar{l})K_S^0(\pi^+\pi^-)$  is studied and the time dependent CPV parameter  $\sin 2\phi_1$  is extracted.
- CPV is assumed only from the  $B^0$  mixing ( $A_{CP} = 0$ ).
- The wrong sign tag ratio  $w = (20.9 \pm 2.1)\%$  is obtained from the  $B^0 \rightarrow D^-(K^+\pi^-\pi^-)\pi^+$  sample where  $\Delta m_d = (0.531 \pm 0.046 \pm 0.013) \text{ ps}^{-1}$ .

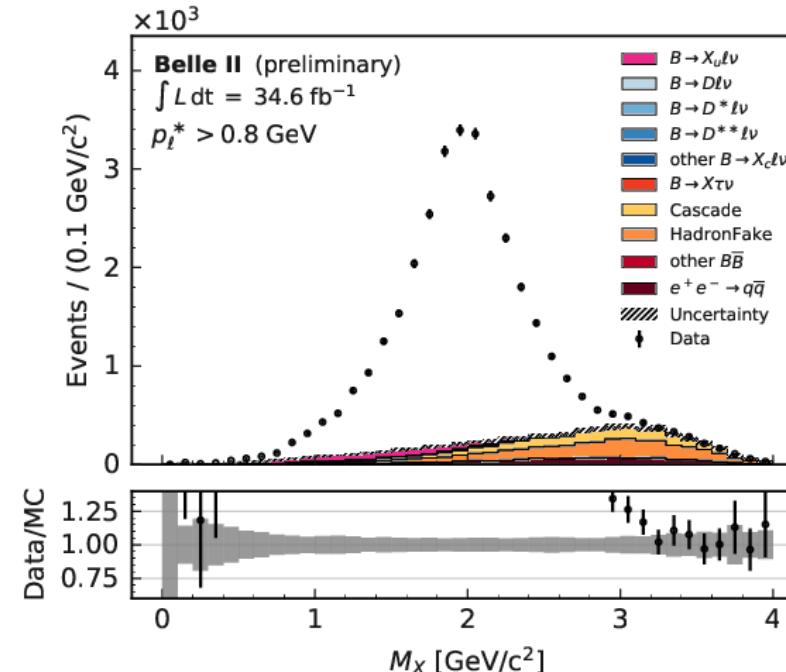

# Toward $V_{cb}$ and $V_{ub}$ : Semi-Leptonic Decays

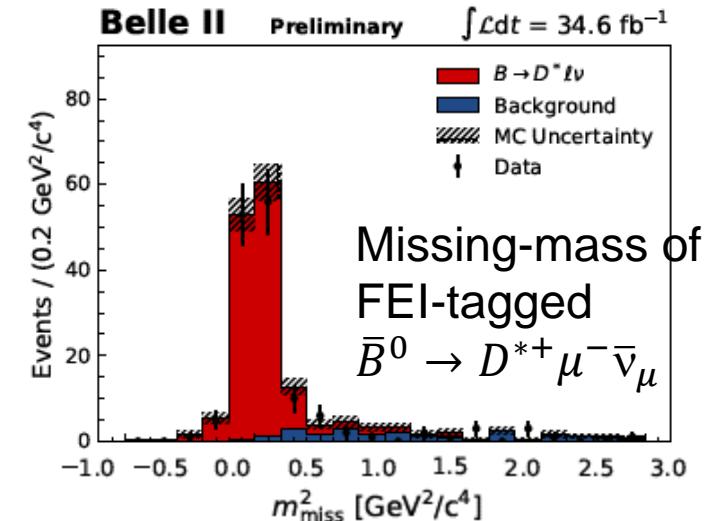

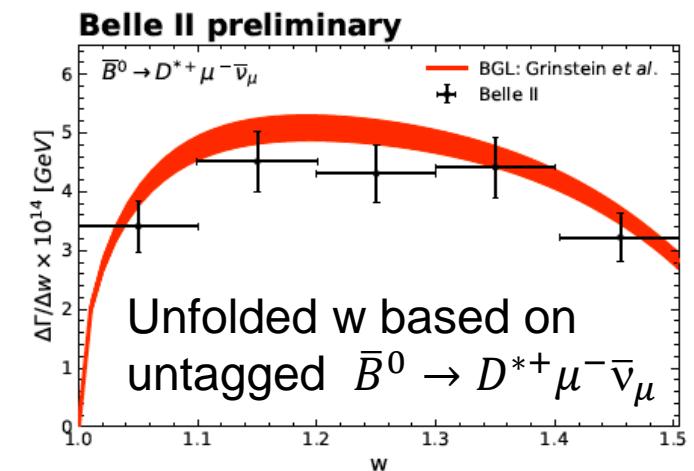

(Talk Cheaib, July 29<sup>th</sup> & poster Granderath, July 29<sup>th</sup>)

Untagged  $B \rightarrow X_u e \nu_e$  at the endpoint region of electron momentum

Hadronic mass moment  $M_X$  of FEI-tagged  $B \rightarrow X_c \ell \nu$

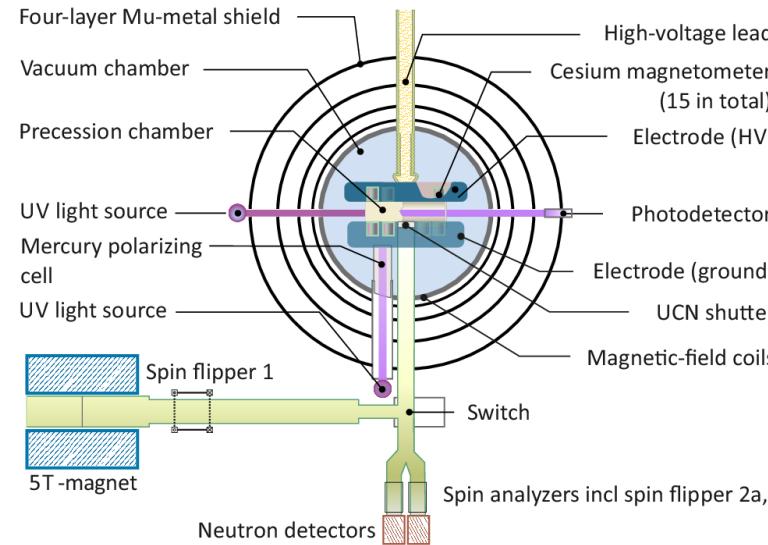

# Summary

- Measurement on  $\gamma$  slowly enters the precision area.
  - Inputs from charm/beauty experiments are needed.
- The CKM elements are being updated relentlessly.
  - (semi)-leptonic decay modes are leading the efforts.
- Belle II started generating comparable physics results.
- The CKM/CPV is a great handle to look for new physics.

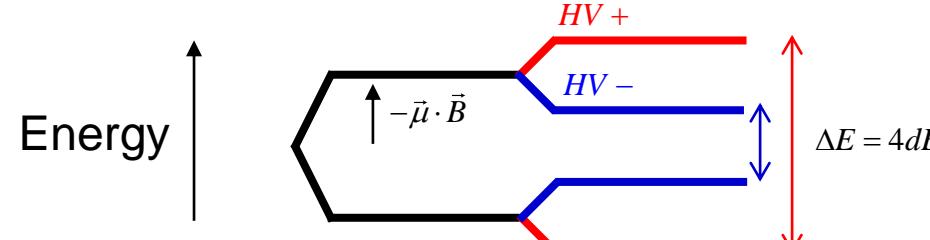

# **EXTRA**

# nEDM: neutron Electric Dipole Moment

$$H = -\vec{\mu} \cdot \vec{B} - \vec{d} \cdot \vec{E} \Rightarrow \text{Larmor precession}$$

(Ayres @ FPCP 2020)

- A new measurement at Paul Scherrer Institute (Phys. Rev. Lett. **124**, 081803)
- Classically, EDM represents an asymmetric charge distribution inside a particle.
- Non-zero EDM in neutron implies T violation. Under CPT conservation, it also means CPV.
- Ramsey's method was used to extract frequency of ultracold neutrons in B and E fields.

$$d_n = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26} e.\text{cm}$$

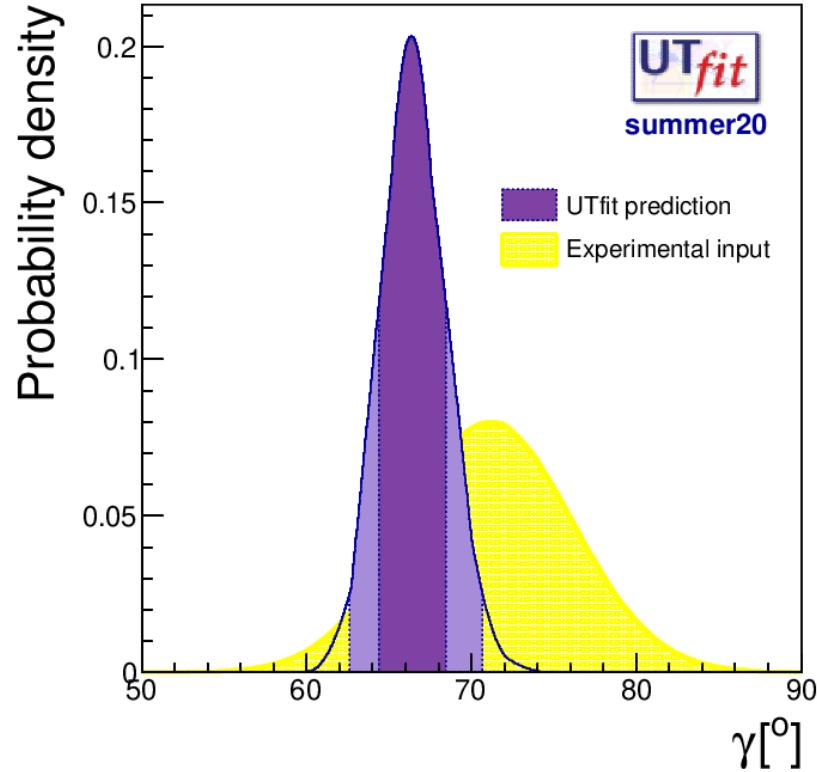

$$\Rightarrow |d_n| < 1.8 \times 10^{-26} e.\text{cm} \text{ (90% C.L.)}$$

- Previously, Phys. Rev. **29**, 092003 (2015)

$$d_n = (-0.2 \pm 1.5 \pm 1.0) \times 10^{-26} e.\text{cm}$$

$$\Rightarrow |d_n| < 3 \times 10^{-26} e.\text{cm} \text{ (90% C.L.)}$$

# UTfit Update of $\gamma$ : ICHEP 2020

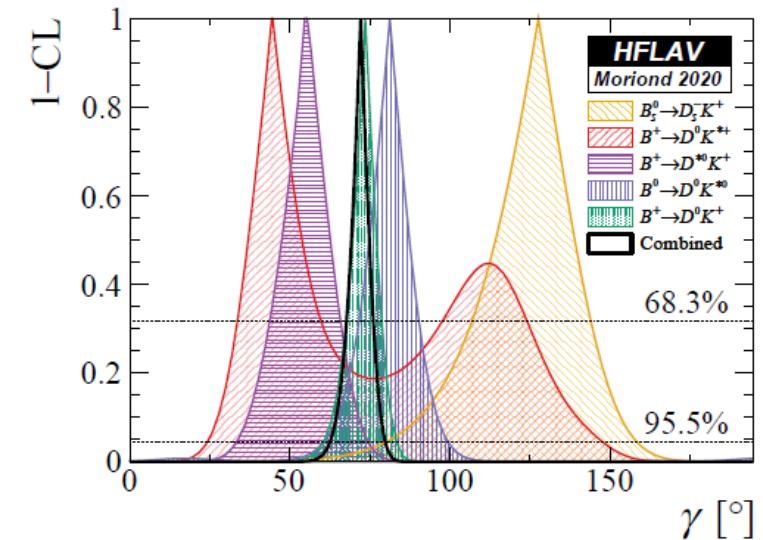

- Plot courtesy: Marcella Bona

Input: HFLAV  $\gamma(\text{exp}) = (71.1 \pm 5.0)$  deg

Output: UTfit prediction  $\gamma = (66.4 \pm 2.0)$  deg

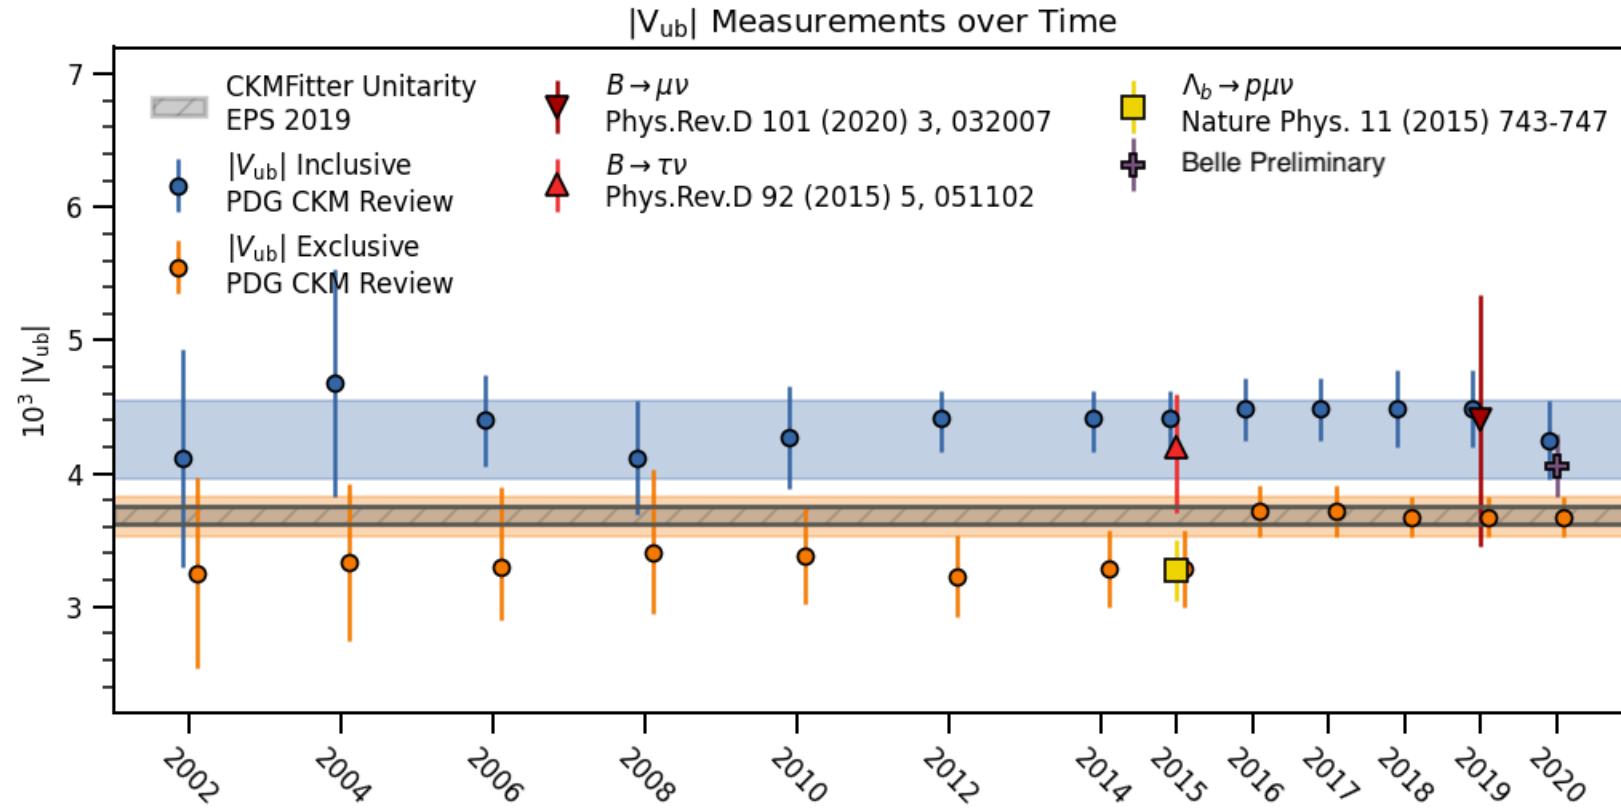

# Final D Category for Measurement of $\gamma$

- GLW: CP eigenstate D decays
  - $D \rightarrow KK, D \rightarrow \pi\pi$ . Phys. Lett. B 253, 483 (1991), Phys. Lett. B 265, 172 (1991)
- ADS: CF or DCS D decays
  - $D \rightarrow K\pi$ . Phys. Rev. Lett. 78, 3257 (1997), Phys. Rev. D63, 036005 (2001)
- BPGBSZ: D to 3 body final states
  - $D \rightarrow K_S^0\pi\pi$ . Phys. Rev. D68, 054018 (2003)
- TD (time dependent): Interference between mixing and decay
- Dalitz: 3-body B decays with a neutral D
  - $B \rightarrow \bar{D}^0K\pi$ . Phys. Rev. D79, 051301 (2009)

Prog. Theor. Exp. Phys. 2020 083C01 (2020)

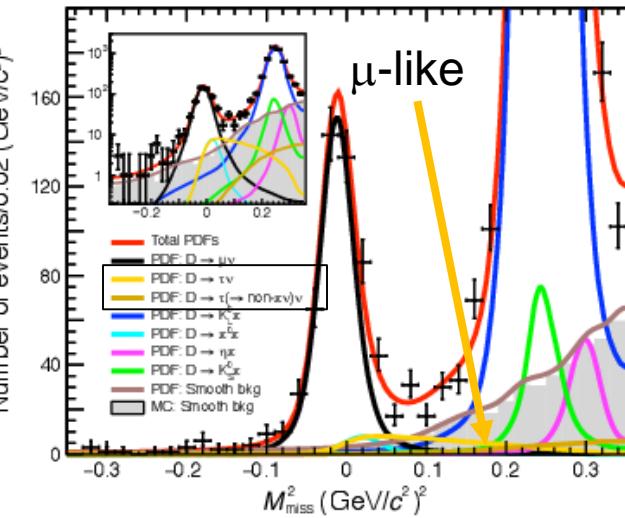

# History of $V_{ub}$ Measurements

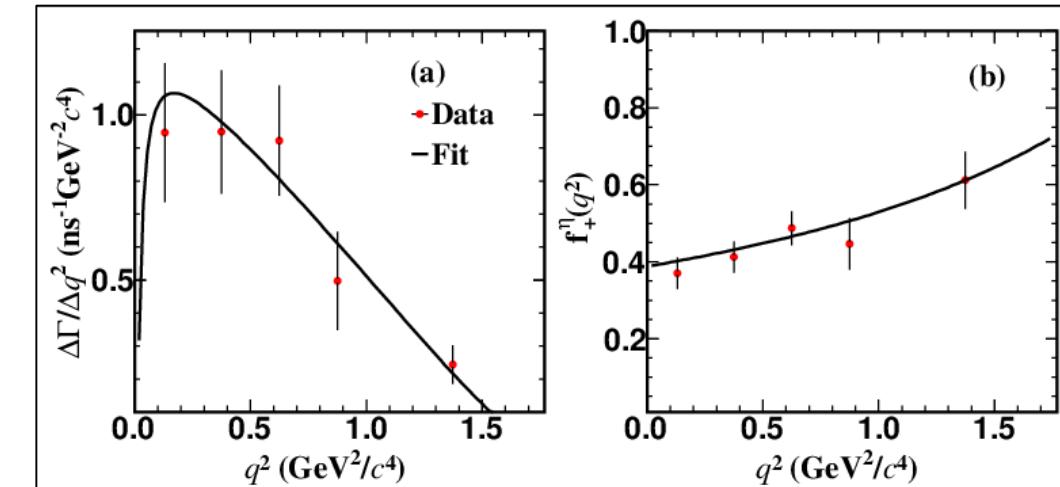

- Plot courtesy: Belle
- Also <https://hflav-eos.web.cern.ch/hflav-eos/semi/summer16/html/InclusiveVub/inclXulnu.html>

# Other (Semi)-Leptonic Decays

Observation of  $D^+ \rightarrow \tau^+ \nu_\tau$  by BES III.  
 Phys. Rev. Lett. **123**, 211802

First measurement of BF  $D^+ \rightarrow \eta \mu^+ \nu_\mu$  by BES III.  
 Phys. Rev. Lett. **124**, 231801

- Note that the signal is represented by **yellow curves**.
- With LQCD inputs on  $f_{D+}$  (ETM 2015, Fermilab + MILC 2018),  
 $|V_{cd}| = 0.237 \pm 0.024 \pm 0.012 \pm 0.001$  (theory)

- Fit to  $f_+^\eta(0)|V_{cd}| = 0.087 \pm 0.008 \pm 0.002$ .
- Ivanov et al. (2019) review on  $f_+^\eta(0)$  gives  
 $|V_{cd}| = 0.242 \pm 0.022 \pm 0.006 \pm 0.033$  (theory)
- Note) PDG 2020  $|V_{cd}| = 0.221 \pm 0.004$
