$B^+ \rightarrow D_s^+ D^0$ decay reconstruction in Early Phase III data

F. Pham*

University of Melbourne, Australia

Abstract

This note contains the approved plots for the analysis documented in BELLE2-NOTE-PH-2019-056. More details at: <https://docs.belle2.org/record/1675?ln=en>

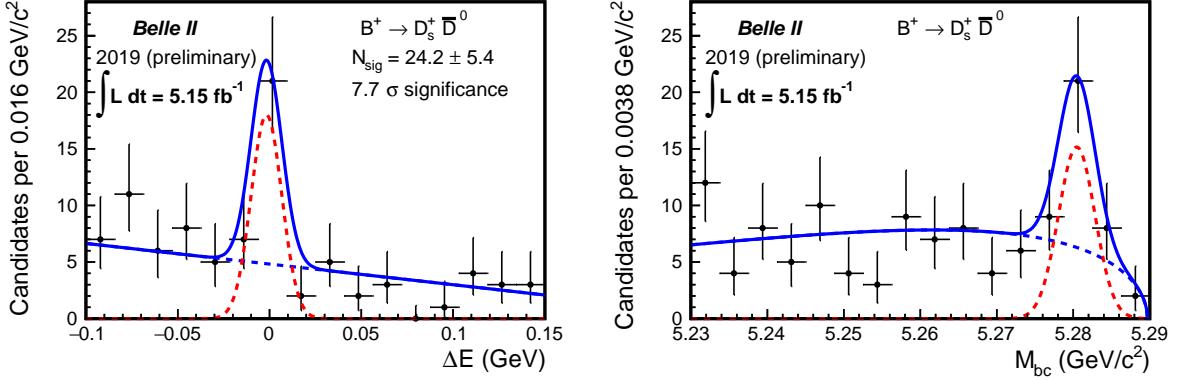

FIG. 1: Signal enhanced distributions of ΔE (left) and M_{bc} (right) for $B^+ \rightarrow D_s^+ D^0$ candidates reconstructed proc9 + prompt data. The signal region is defined as $|\Delta E| < 0.05 \text{ GeV}$ and $M_{bc} > 5.27 \text{ GeV}/c^2$. The signal is reconstructed in the following decay modes: $B^\mp \rightarrow D_s^\mp [\rightarrow \phi(\rightarrow K^+ K^-) \pi^\mp] D^0 (\rightarrow K^- \pi^+, K^- \pi^+ \pi^0, K^- \pi^+ \pi^- \pi^+)$. Plots are formatted for public showing at Beauty.
